DISASTER RESEARCH:
UNDERSTANDING HAZARDS AND DISASTERS

COURSE SYLLABUS

SPRING 2016

Instructors: Bruce Houghton and Chris Gregg
Phone: 956-2561 (B),
Email: bhought@soest.hawaii.edu, gregg@etsu.edu

POST 703
Mondays, 5 – 8 PM
COURSE DESCRIPTION

_disaster Research_ will be taught in a seminar format consisting of learning environments in both the field and the classroom. A weekend field excursion to the Big Island of Hawai’i is voluntary, and will provide first-hand familiarity with several of the hazards to be discussed in the class. Classes will include a combination of lectures by the instructors, guests, and case studies presented by the students. Lectures are split into two sections: one addresses the physical science of the natural event (and how it happens) while the other concentrates on the social impacts and human responses to natural hazard events using case studies. Seminars provide the foundation for which students will prepare their assignments and presentations. The course has key readings that should be reviewed by the student, as well as many optional ones that provide a more complete understanding of disasters presented in the case studies.

COURSE TOPICS

**INTRODUCTION:** We will discuss how to define a disaster, as well as the frequency and intensity of disasters. This lecture will set up the course framework and make some brief comparisons between many types of disasters of recent years. We will discuss how to understand 1) physical processes of hazards, 2) scales of hazard impact (dependent on hazard intensity and types of communities affected), and 3) societal reactions to the events (social, political, and economical). Four types of events will be singled out for case studies of disasters.

- What is a disaster (1 hour)
- The social science of disasters (2 hours)
- Risk and resilience (1 hour)

**MODULE:**

**VOLCANIC CRISE MODULES:** Volcanic eruptions are unique among hazards faced by societies due to 1) the long-lived nature of an event, 2) multiple hazards can be spawned by one event,
can have widespread impact, and 4) warning signs are typically present for days to months (sometimes causing fatigue and indifference). In the first section of this module, we will discuss how eruptions are classified, what causes eruptions (with analogue experiments), products of eruptions, and how hazards strain communities both near and far. In the second section of this module, we will consider socio-economical and political effects of the Mt. Pinatubo (1991, Philippines) and Eyjafjallajokull (2010, Iceland) eruptions.

- The Volcano Problem (1 hour)
- The Pulse of the Volcano (1 hour)
- Mount St Helens 2004 exercise (1 hour)
- Case Studies (1 hour)

**EXTREME WEATHER MODULE:** Hurricanes are regional events that last for hours to days, and provide days to a week of warning time. There is typically time to prepare for a hurricane or evacuate from a predicted area to be adversely affected, provided that communities have the means to do so. In the first section of this module, we will discuss how hurricanes are classified, why/how/where they form, factors contributing to their intensity, and the hazards posed by them. In the second section of this module, we will consider the social, political, and infrastructural impacts of Hurricane Katrina (2005, USA), and in less detail, Hurricane Sandy (2012, USA) and compare these events to other smaller intense weather systems.

- Fundamentals of extreme weather (1 hours)
- Weather observations and predictions (1 hour)
- Katrina case study (2 hours)
- Sandy case study (1 hour)
- Tornado and storm case studies (1 hours)

**EARTHQUAKES MODULE:** Earthquakes are short-lived, regional events with little to no warning time. Earthquakes rarely kill people is, rather, it is infrastructural damage caused by the earthquake that kills people. We will discuss how earthquakes are classified, where they typically occur, and how scientists measure them, factors leading to the intensity of shaking felt by communities, and why this ground motion causes damage to infrastructure. We will consider economic and human costs of earthquakes, social and political responses, and how preparation/community resilience can dramatically alter the recovery time for an earthquake. The focus will be on a case study of Kobe (1991, is on Kobe, Japan with comparison to 21st century earthquakes.

- Physiological nature and impacts of earthquakes (1 hours)
- Social nature of earthquake disasters and case studies (2 hours)
- L’Aquila trial (1 hour)
are of international extent, accompanied by great earthquakes, and provide up to several hours of warning time. In the first section of this module, we will discuss what a tsunami is, how ocean-wide damaging tsunamis are generated, how we measure them both on land and in the ocean basin, what damage they can cause, why the same tsunami may behave differently at different coastlines, and classic warning signs that a tsunami is imminent. In the second section of this module, we will analyze and reflect on the first-ever recorded Indian Ocean tsunami (2004, Indonesia) and its international social, political, and economic impacts. We will also discuss the recent Tohoku tsunami (2011, Japan).

- Physical nature of tsunamis (1 hour)
- Impacts of tsunamis (1 hour)
- Indian ocean case study (1 hour)
- Tohoku case study (1 hour)

**STUDENT PRESENTATIONS:** Order of presentations is TBA. Students will pick their own disaster and give a 20 minute presentation to the class on what the hazard was, and why the result was a disaster. Any event (world wide) is eligible, but duplicates in the class are not allowed. Sign up for your event as soon as you are decided on it.

### COURSE EVALUATION

<table>
<thead>
<tr>
<th>ACTIVITY</th>
<th>WEIGHT</th>
<th>GRADE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Big Island Assignment</td>
<td>25%</td>
<td>&gt;90% = A</td>
</tr>
<tr>
<td>Tohoku Paper</td>
<td>25%</td>
<td>&gt;80% = B</td>
</tr>
<tr>
<td>Mini Case Study</td>
<td>50%</td>
<td>&gt;70% = C</td>
</tr>
</tbody>
</table>

There will be no extra credit and no curving of final marks.
