HOMOGENEOUS FINITE STRAIN: DISPLACEMENT & DEFORMATION GRADIENTS

I Main Topics
   A Position, displacement, and differences in position of two points
   B Chain rule for a function of two variables
   C Homogenous deformation
   D Examples

II Position, displacement, and differences in position of two points
   * See diagram on next page
   (Capital letters for “total vectors”, lower case for components)
   A Initial position vectors: Pt. 1 (\( \mathbf{X}_1 = x_1 + y_1 \)) Pt. 2 (\( \mathbf{X}_2 = x_2 + y_2 \))
   B Final position vectors: Pt. 1 (\( \mathbf{X}'_1 = x'_1 + y'_1 \)) Pt. 2 (\( \mathbf{X}'_2 = x'_2 + y'_2 \))
   C Displacement vectors
      1 In terms of positions: Pt. 1 (\( \mathbf{U}_1 = \mathbf{X}'_1 - \mathbf{X}_1 \)) Pt. 2 (\( \mathbf{U}_2 = \mathbf{X}'_2 - \mathbf{X}_2 \))
      2 In terms of components: Pt. 1 (\( \mathbf{U}_1 = u_{1x} + u_{1y} \)) Pt. 2 (\( \mathbf{U}_2 = u_{2x} + u_{2y} \))
   D Difference in positions of Points 1 and 2
      1 Difference in initial positions \( \mathbf{dX} = \mathbf{X}_2 - \mathbf{X}_1 \)
      2 Difference in final positions \( \mathbf{dX}' = \mathbf{X}'_2 - \mathbf{X}'_1 \)
Initial Positions and Components of Initial Positions, and Final Positions and Components of Final Positions For Two Points (components in lower case)

\[ \vec{x}_1 = x_1' + y_1' \]
\[ \vec{x}_1' = x_1' + y_1' \]
\[ \vec{x}_2 = x_2 + y_2' \]
\[ \vec{x}_2' = x_2' + y_2' \]

Displacements and Components of Displacements

Point 1 moves to Point 1'. Point 2 moves to Point 2'.

\[ \vec{u}_1 = \vec{x}_1' - \vec{x}_1 \]
\[ \vec{u}_2 = \vec{x}_2' - \vec{x}_2 \]

The vector \( \vec{u}_2 \) is displaced, rotated, and stretched relative to \( \vec{u}_1 \)

Difference in Positions of Two Neighboring Points Before and After Displacement

\[ \frac{d\vec{x}}{dx} = \vec{x}_2 - \vec{x}_1 \]
\[ \frac{d\vec{x}'}{dx} = \vec{x}_2' - \vec{x}_2 \]

These are not displacement vectors! The vectors here describe the position of Point 2 relative to Point 1, and Point 2' relative to Point 1'.

The vector \( \frac{d\vec{x}'}{dx} \) is displaced, rotated, and stretched relative to \( \frac{d\vec{x}}{dx} \)
II Chain rule for a function of two variables
A Chain rule for a function of two variables
1 Chain rule of differential calculus, for a function \( x' = x'(x,y) \):
\[
dx' = \frac{\partial x'}{\partial x} dx + \frac{\partial x'}{\partial y} dy
\]
(where \( dx \) is the distance between 2 nearby pts)

The total change in variable \( x' \) equals the rate that \( x' \) changes with
respect to \( x \), multiplied by the change in \( x \), plus the rate that \( x' \)
changes with respect to \( y \), multiplied by the change in \( y \). Similarly,
\[
dy' = \frac{\partial y'}{\partial x} dx + \frac{\partial y'}{\partial y} dy
\]

In matrix form, equations (1) and (2) yield
\[
3a \begin{bmatrix} dx' \\ dy' \end{bmatrix} = \begin{bmatrix} \frac{\partial x'}{\partial x} & \frac{\partial x'}{\partial y} \\ \frac{\partial y'}{\partial x} & \frac{\partial y'}{\partial y} \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} \quad \text{OR} \quad 3b \quad [dX'] = [F][dX]
\]

Similarly
\[
4 \quad du = \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy
\]
\[
5 \quad dv = \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy
\]
\[
6a \begin{bmatrix} du \\ dv \end{bmatrix} = \begin{bmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{bmatrix} \begin{bmatrix} dx \\ dy \end{bmatrix} \quad \text{OR} \quad 6b \quad [dU] = [J_u][dX]
\]

At a particular point the derivatives have a unique (or constant)
value, so the equations are linear in \( dx \) and \( dy \) in the neighborhood of
the point (i.e., \( dx' \) and \( dy' \) depend on \( dx \) and \( dy \) raised to the first
power. If the derivatives do not vary with \( x \) or \( y \), then they have the
same value everywhere, and the equations are linear in \( dx \) and \( dy \) no
matter how large \( dx \) and \( dy \) are. This is the condition of homogenous
strain. In that case, since \( dx = x_2-x_1 \), if point 1 is at the origin and
point 2 is at \( (x,y) \), then \( dx = x \). Similarly, \( dy = y \), \( dx' = x' \), \( dy' = y' \),
\( du = u \), and \( dv = v \). These replacements can be made in all the
equations above, and the solutions are valid no matter how large \( x \)
and \( y \) are. This leads to the equations in the section III.

B Chain rule for a function of three variables
\[
dx' = \frac{\partial x'}{\partial x} dx + \frac{\partial x'}{\partial y} dy + \frac{\partial x'}{\partial z} dz \quad \text{(etc.)}
\]
III Homogenous (uniform) deformation
A Equations of homogeneous 2-D strain

1 Lagrangian (final positions $(x',y')$ in terms of initial positions $(x,y)$)
   a $x' = ax + by$ (a and b are constants; compare with II.A.1)
   b $y' = cx + dy$ (c and d are constants; compare with II.A.2)

2 Eulerian (initial positions $(x,y)$ in terms of final positions $(x',y')$)
   a $x = Ax' + By'$ (see derivation below)
     i $y = (x' - ax)/b$ and $y = (y' - cx)/d$
     ii $(x' - ax)/b = (y' - cx)/d$
     iii $d(x' - ax) = b(y' - cx)$
     iv $cbx - adx = by' - dx'$
     v $x = (by' - dx')/(cb-ad)$ This yields $x = x(x', y')$
   b $y = Cx' + Dy'$ (see derivation below)
     i $x = (y' - dy)/c$ and $x = (x' - by)/a$
     ii $(y' - dy)/c = (x' - by)/a$
     iii $a(y' - dy) = c(x' - by)$
     iv $cby - ady = cx' - ay'$
     v $y = (cx' - ay')/(cb-ad)$ This yields $y = y(x', y')$

B Straight parallel lines in an initial state $(X=x, y)$ remain straight and parallel in the final (current) state $(X'=x', y')$ (see appendix)

C Parallelograms deform into parallelograms in 2-D; parallelepipeds deform into parallelepipeds in 3-D

D Circles deform into ellipses in 2-D (see appendix); Spheres deform into ellipsoids in 3-D

E Considered a useful concept in geology for “small” regions – over large regions deformation invariably is inhomogeneous (non-uniform)

F Describing the shape, orientation, and rotation of the strain ellipse of ellipsoid is a useful way to describe the deformation. The rotation is the angle between the axes of the strain ellipse and their counterparts before any deformation occurred.
Deformed and undeformed positions are described by linear coordinate transformation equations (2-D examples below in matrix form)

1. \[ x' = ax + by \]
2. \[ y' = cx + dy \]

(See III.A.1.a and II.A.1.b)

2. \[
\begin{bmatrix}
  x' \\
  y'
\end{bmatrix} =
\begin{bmatrix}
  a & b \\
  c & d
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}, \text{ where } \begin{bmatrix}
  a & b \\
  c & d
\end{bmatrix} = \text{deformation gradient matrix } [F]
\]

3. \[
\begin{bmatrix}
  x' \\
  y'
\end{bmatrix} = [F] \begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

The displacements also are described by linear displacement equations (2-D examples below)

1. \[ u = x' - x = (ax + by) - x = (a-1)x + by \]
2. \[ v = y' - y = (cx + dy) - y = cx + (d-1)y \]

(Compare with II.A.4, II.A.5)

2. \[
\begin{bmatrix}
  u \\
  v
\end{bmatrix} = \begin{bmatrix}
  a-1 & b \\
  c & d-1
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}, \text{ where}
\]

\[
\begin{bmatrix}
  a-1 & b \\
  c & d-1
\end{bmatrix} = \begin{bmatrix}
  e & f \\
  g & h
\end{bmatrix} = \text{displacement vector gradient matrix } [J_u]
\]

3. \[
\begin{bmatrix}
  U
\end{bmatrix} = [J_u] \begin{bmatrix}
  X
\end{bmatrix}
\]

a. \([J_u]\) is the Jacobian matrix for displacements \((u)\)

b. A Jacobian matrix is a matrix of all the first-order partial derivatives of a vector function. It represents the linear approximation of the function near a point of interest.

c. For homogeneous strain, the partial derivatives are constants.

4. \[ J_u = F - I, \text{ where } I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \]

IV Examples
## A No deformation

### Coordinate transformation equations (Lagrangian)

\[
\begin{align*}
x' &= 1x + 0y \\
y' &= 0x + 1y
\end{align*}
\]

\[
\begin{bmatrix}
[x'] \\
[y']
\end{bmatrix} =
\begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix}
\begin{bmatrix}
x \\
y
\end{bmatrix}
\]

### Displacement equations (Lagrangian)

\[
\begin{align*}
\dot{u}_x &= 0x + 0y \\
\dot{u}_y &= 0x + 0y
\end{align*}
\]

\[
\begin{bmatrix}
\dot{u}_x \\
\dot{u}_y
\end{bmatrix} =
\begin{bmatrix}
0 & 0 \\
0 & 0
\end{bmatrix}
\begin{bmatrix}
x \\
y
\end{bmatrix}
\]

#### Coordinate transformation equations (matrix form)

\[
\begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix}
\]

#### Displacement equations (matrix form)

\[
\begin{bmatrix}
0 & 0 \\
0 & 0
\end{bmatrix}
\]

#### Deformation gradient tensor $F$

\[
F = \begin{bmatrix}
1 & 0 \\
0 & 1
\end{bmatrix}
\]

#### Displacement gradient tensor $J_u$

\[
J_u = \begin{bmatrix}
0 & 0 \\
0 & 0
\end{bmatrix}
\]
B Rigid body translation

Undeformed (dashed black) and homogenously deformed (solid red) objects

\[x' = 1x + 0y + c_x\]
\[y' = 0x + 1y + c_y\]

Coordinate transformation equations (Lagrangian)

\[
\begin{bmatrix}
  x' \\
  y'
\end{bmatrix} =
\begin{bmatrix}
  1 & 0 \\
  0 & 1
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix} +
\begin{bmatrix}
  c_x \\
  c_y
\end{bmatrix}
\]

Displacement equations (Lagrangian)

\[
\begin{bmatrix}
  u_x \\
  u_y
\end{bmatrix} =
\begin{bmatrix}
  0 & 0 \\
  0 & 0
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

Coordinate transformation equations (matrix form)

\[
\begin{bmatrix}
  1 & 0 \\
  0 & 1
\end{bmatrix}
\]

Deformation gradient tensor \( F \)

Displacement gradient tensor \( J_u \)
C Rigid body rotation

Undeformed (dashed black) and homogenously deformed (solid red) objects

Coordinate transformation equations (Lagrangian)

\[
\begin{align*}
x' &= \cos 60^\circ x - \sin 60^\circ y \\
y' &= \sin 60^\circ x + \cos 60^\circ y
\end{align*}
\]

\[
\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} \cos 60^\circ & -\sin 60^\circ \\ \sin 60^\circ & \cos 60^\circ \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}
\]

Displacement equations (Lagrangian)

\[
\begin{align*}
x &= \cos 60^\circ - \sin 60^\circ y \\
y &= \sin 60^\circ x + \cos 60^\circ - 1 y
\end{align*}
\]

\[
\begin{bmatrix} u_x \\ u_y \end{bmatrix} = \begin{bmatrix} \cos 60^\circ - 1 & -\sin 60^\circ \\ \sin 60^\circ & \cos 60^\circ - 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}
\]

Deformation gradient tensor \( F \)

\[
\begin{bmatrix} \cos 60^\circ & -\sin 60^\circ \\ \sin 60^\circ & \cos 60^\circ \end{bmatrix}
\]

Displacement gradient tensor \( J_u \)

\[
\begin{bmatrix} \cos 60^\circ - 1 & -\sin 60^\circ \\ \sin 60^\circ & \cos 60^\circ - 1 \end{bmatrix}
\]
### Uniaxial shortening (parallel to y-axis)

Undeformed (dashed black) and homogenously deformed (solid red) objects

#### Coordinate transformation equations

- **Lagrangian**
  - $x' = x + 0y$
  - $y' = 0x + 0.5y$

- **Matrix form**
  - $\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 0.5 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$

#### Displacement equations

- **Lagrangian**
  - $u_x = 0x + 0y$
  - $u_y = 0x - 0.5y$

- **Matrix form**
  - $\begin{bmatrix} u_x \\ u_y \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & -0.5 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$

#### Deformation gradient tensor $F$

- $\begin{bmatrix} 1 & 0 \\ 0 & 0.5 \end{bmatrix}$

#### Displacement gradient tensor $J_u$

- $\begin{bmatrix} 0 & 0 \\ 0 & -0.5 \end{bmatrix}$

No rotation
E Dilation

Undeformed (dashed black) and homogenously deformed (solid red) objects

\[ x' = 2x + 0y \]
\[ y' = 0x + 2y \]

Coordinate transformation equations (Lagrangian)

\[ \begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} \]

Coordinate transformation equations (matrix form)

\[ \begin{bmatrix} u_x \\ u_y \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} \]

Displacement equations (matrix form)

\[ \begin{bmatrix} u_x \\ u_y \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} \]

No rotation

\[ \begin{bmatrix} 2 & 0 \\ 0 & 2 \end{bmatrix} \]

Deformation gradient tensor \( F \)

\[ \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \]

Displacement gradient tensor \( J_u \)
F Pure shear strain (biaxial strain, no dilation)

Undeformed (dashed black) and homogenously deformed (solid red) objects

\[ x' = 2x + 0y \]
\[ y' = 0x + 0.5y \]

Coordinate transformation equations (Lagrangian)

\[
\begin{bmatrix}
  x' \\
  y'
\end{bmatrix} =
\begin{bmatrix}
  2 & 0 \\
  0 & 0.5
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

Coordinate transformation equations (matrix form)

\[ \begin{bmatrix}
2 & 0 \\
0 & 0.5
\end{bmatrix} \]

Deformation gradient tensor \( F \)

\[ u_x = 1x + 0y \]
\[ u_y = 0x - 0.5y \]

Displacement equations (Lagrangian)

\[
\begin{bmatrix}
  u_x \\
  u_y
\end{bmatrix} =
\begin{bmatrix}
  1 & 0 \\
  0 & -0.5
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

Displacement equations (matrix form)

\[ \begin{bmatrix}
1 & 0 \\
0 & -0.5
\end{bmatrix} \]

Displacement gradient tensor \( J_u \)

No rotation
Simple shear strain parallel to the x-axis (no dilation)

deformation gradient tensor \( F \)

Coordinate transformation equations
\[
\begin{bmatrix}
  x' \\
  y'
\end{bmatrix} =
\begin{bmatrix}
  1 & 2 \\
  0 & 1
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

\[
\begin{bmatrix}
  x' = 1x + 2y \\
y' = 0x + 1y
\end{bmatrix}
\]

Displacement equations (Lagrangian)
\[
\begin{bmatrix}
  u_x \\
  u_y
\end{bmatrix} =
\begin{bmatrix}
  0 & 2 \\
  0 & 0
\end{bmatrix}
\begin{bmatrix}
  x \\
  y
\end{bmatrix}
\]

\[
\begin{bmatrix}
  u_x = 0x + 2y \\
u_y = 0x + 0y
\end{bmatrix}
\]

Displacement equations (matrix form)
\[
\begin{bmatrix}
  0 & 2 \\
  0 & 0
\end{bmatrix}
\]

There is a rotation
General deformation (plain strain)

Undeformed (dashed black) and homogenously deformed (solid red) objects

Coordinate transformation equations (Lagrangian)

\[
\begin{bmatrix}
    x' \\
    y'
\end{bmatrix} = \begin{bmatrix} 2 & 1 \\ 0 & -0.5 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}
\]

Displacement equations (Lagrangian)

\[
\begin{bmatrix}
    u_x \\
    u_y
\end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 0 & -1.5 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}
\]

There is a rotation.
General comments on the deformation gradient and displacement gradient tensors

1. The tensors that describe deformation of a body depend on derivatives of positions or displacements.

2. For cases of no deformation (case A) and rigid body translation (case B) the respective tensors are identical, even though the equations they are derived from differ. The constant displacement terms ($c_x$ and $c_y$) drop out in forming the tensors. The deformation gradient and displacement gradient tensors therefore provide no information on the presence or absence of a rigid body translation.

3. For cases of no deformation (case A) and rigid body rotation (case C) the respective tensors are different. The deformation gradient and displacement gradient tensors therefore do provide information on the presence or absence of a rigid body rotation; this information is in the off-diagonal terms, which have equal magnitude and opposite sign.

4. The meaning of the components of the tensors are straightforward in terms of derivatives, but we still need to understand the meaning of the components in terms of the measures of normal and shear strain.

5. If the initial positions are not known, then they must be inferred (or guessed at): this situation is common in geology and introduces uncertainty in strain calculations.
Appendix

A Homogeneous deformation of parallel lines to parallel lines

Consider a pair of parallel lines in the undeformed state
1a \ y = mx + B \\
1b \ \ y = mx + B^*

The x,y coordinates in terms of the x',y' coordinates are:
2 \ x = (dx'-by')/(ad-bc) \\
3 \ y = (ay'-cx')/(ad-bc)

Substituting (2) and (3) into (1) yields

\[ 4a \ \frac{ay' - cx'}{ad - bc} = m \frac{dx' - by'}{ad - bc} + B \]
\[ 4b \ \frac{ay' - cx'}{ad - bc} = m \frac{dx' - by'}{ad - bc} + B^* \]

Move the x' and y' terms to opposite sides of the equations

\[ 5a \ \frac{(a+mb)y'}{ad - bc} = \frac{(c+md)x'}{ad - bc} + B \]
\[ 5b \ \frac{(a+mb)y'}{ad - bc} = \frac{(c+md)x'}{ad - bc} + B^* \]

Multiplying both sides of (5) by \( \frac{ad - bc}{a + mb} \) yields equations for two lines

\[ 6a \ y' = \frac{(c+md)x'}{(a+mb)} + B \frac{ad - bc}{a + mb} \]
\[ 6b \ y' = \frac{(c+md)x'}{(a+mb)} + B^* \frac{ad - bc}{a + mb} \]

Parallel lines \( y = mx + B \) and \( y = mx + B^* \) transform to two parallel lines.

B Homogeneous deformation of a unit circle to an ellipse

1 \( x^2 + y^2 = 1 \) or \( x^2 + y^2 - 1 = 0 \)
2 \( \frac{[by'-dx']^2}{cb - ad} + \frac{[cx'-ay']^2}{cb - ad} - 1 = 0 \)
3 \( x^2 \left[ \frac{d^2 + c^2}{cb - ad} \right] - xy' \left[ \frac{2bd + 2ac}{cb - ad} \right] + y'^2 \left[ \frac{a^2 + b^2}{cb - ad} \right] - 1 = 0 \)

Equation (3) has the form of an ellipse oblique to the x,y axes

\[ 4 \ C_1 x^2 + C_2 xy + C_3 y^2 + C_4 x + C_5 y + C_6 = 0 \quad (C_1, C_3 > 0) \]

Since (3) and (4) have the same form, the circle transforms to an ellipse.

plot(xc,yc,'--k'); % Plots the undeformed circle in black
hold on
plot(xcp,ycp,'r'); % Plots the deformed circle in red

% Find the principal axes using the Greens deformation tensor C
[vC,dC] = eig(C)
plot([X_cp(1),X_cp(1)+vC(1,1)],[X_cp(2),X_cp(2)+vC(1,2)],'r');
plot([X_cp(1),X_cp(1)+vC(2,1)],[X_cp(2),X_cp(2)+vC(2,2)],'r');
[vBp,dBp] = eig(Bp)
plot([X_c(1),X_c(1)+vBp(1,1)],[X_c(2),X_c(2)+vBp(1,2)],'--k');
plot([X_c(1),X_c(1)+vBp(2,1)],[X_c(2),X_c(2)+vBp(2,2)],'--k');

% Now plot the displacement vectors with "nice-looking" heads
% The arrow heads produced by the "stock" version of quiver (below) are too big
%quiver(x,y,ux,uy,0); % Plots the displacement vectors with no scaling
% So first plot lines with no arrowheads connecting the vector
tails and heads
for i=1:4
    line([x(i),xp(i)],[y(i),yp(i)])
end

% and then use quiver to draw arrows of UNIT length with heads where I want heads
dx = zeros(size(x));
dy = zeros(size(y));
scalefactor = sqrt( (x-xp).^2 + (y-yp).^2 );
k = find(scalefactor);
    % Finds nonzero scalefactors
dx(k) = 0.25*(xp(k) - x(k))./scalefactor(k);
dy(k) = 0.25*(yp(k) - y(k))./scalefactor(k);
quiver (xp-dx,yp-dy,dx,dy,0);
axis('equal')

% Now label the plots
xlabel('x')
ylabel('y')
title('Undeformed (dashed black) and homogenously deformed (solid red) objects')
References

* These are particularly good for undergraduate students
