

# PSAT Meta Data Analysis Project

**Mike Musyl, Rich Brill, Yonat Swimmer, Lianne McNaughton**

**Michael Domeier, Nicole Nasby-Lucas, Molly Lutcavage, Ben Galuardi,  
Francois Royer, Steve Wilson, Joe Liddle**

# This study is designed to look at variables explaining:

- Failure rates (percent reporting)
- Percentage of retrieved depth, temperature, and geolocation data
- Retention rates
- Longevity of attachment

**Comparisons to be made using data from 662 PSATs  
deployments worldwide**

It is anticipated that:

Patterns will emerge with respect to:  
attachment methodologies,  
target species,  
experimental design.

Allows unprecedented critical appraisal of the overall efficacy of PSAT technology.

Cost Benefit analysis to improve experimental design

# Variables in the PSAT Performance Evaluation:

# 662 PSATs deployed on 18 Species

**2000-2004**

**Bigeye thresher (7)**

**Bigeye Tuna (4)**

**Black Marlin (57)**

**Blue Marlin (34)**

**Blue Shark (32)**

**Green Turtle (1)**

**Loggerhead turtle (8)**

**Olive Ridley turtle (15)**

**Short-fin Mako shark (4)**

**Silky Shark (4)**

**Striped Marlin (200)**

**Swordfish (36)**

**Oceanic White-tip shark (8)**

**Yellowfin Tuna (17)**

**Basking shark (1)**

**Great White (48)**

**Tarpon (40)**

**Bluefin tuna (146)**

# Difficult problem

## PSAT failure rates

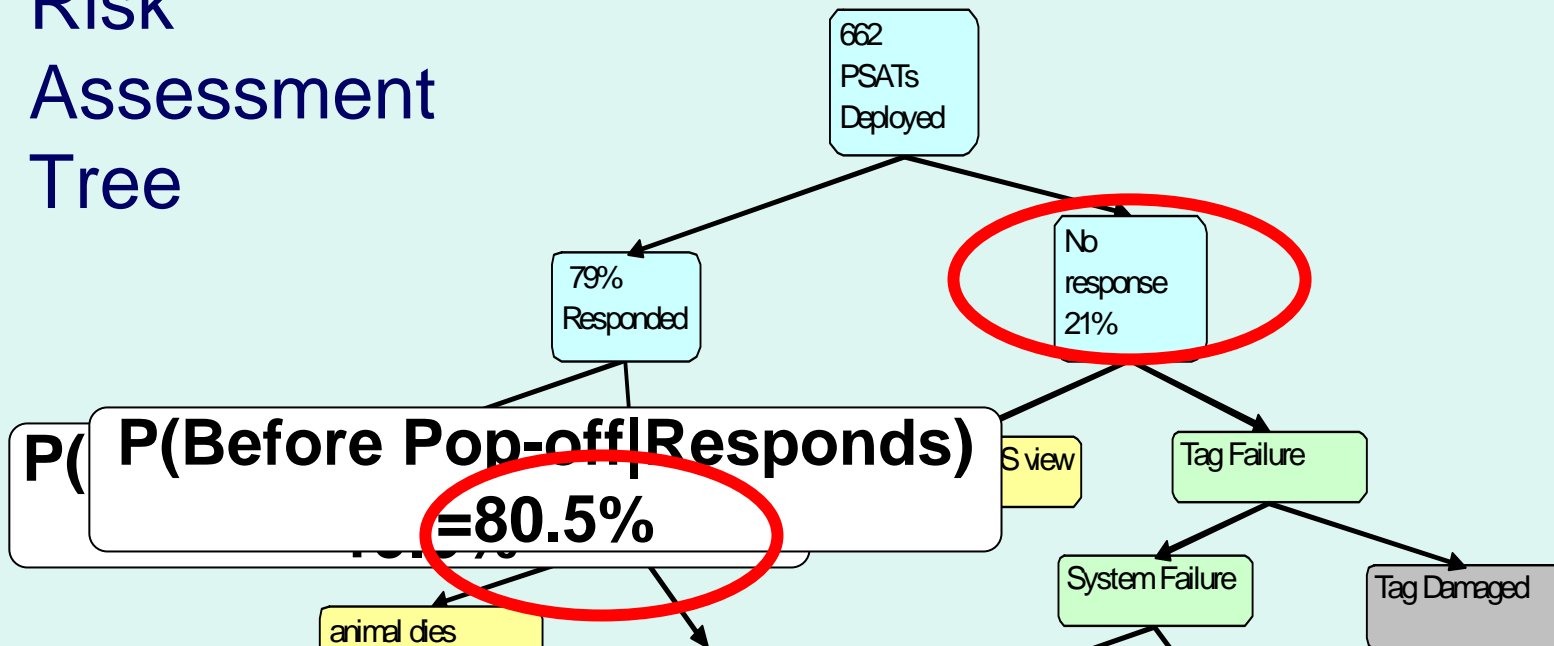

- Never hear from failed PSATS
- Very few PSATs recovered for inspection
- Exact failure mode(s) unknown
- Shouldn't limit discovery
- Exploration of data reveals much
- Ideas to improve methods

# Tag Failure Modes

- **Battery failure – passivation over time (temperature dependent)?**
- **Rupture of pressure housings/seals, contraction/expansion, etc. – (extensive vertical movements = low reporting rates of PSATs swordfish & bigeye thresher sharks)?**
- **Sharks predation/nuptial bites (sharks attracted to the EMF of PSATs, very few tagged males report back)?**
- **Damage to antennae by predation or fouling organisms?**
- **Malfunction other than battery -Fusible link and/or RD1500?**

# Risk Assessment Tree

- Blue: We can estimate now.
- Yellow: Others have done it.
- Green: We have plans to do it.
- Grey: Perhaps unknowable?

Of 662 PSATs attached to sharks, billfish, tunas and turtles, 520 or 79% reported data.

87 or 17% hit their programmed pop-off date

142 or 21% Non-reporting tags is not synonymous with mortality.

# **18 Species grouped into 4 Depth classes**

**4 Depth classes group 18 species**

**0=Littoral**

**1=Epi-Pelagic**

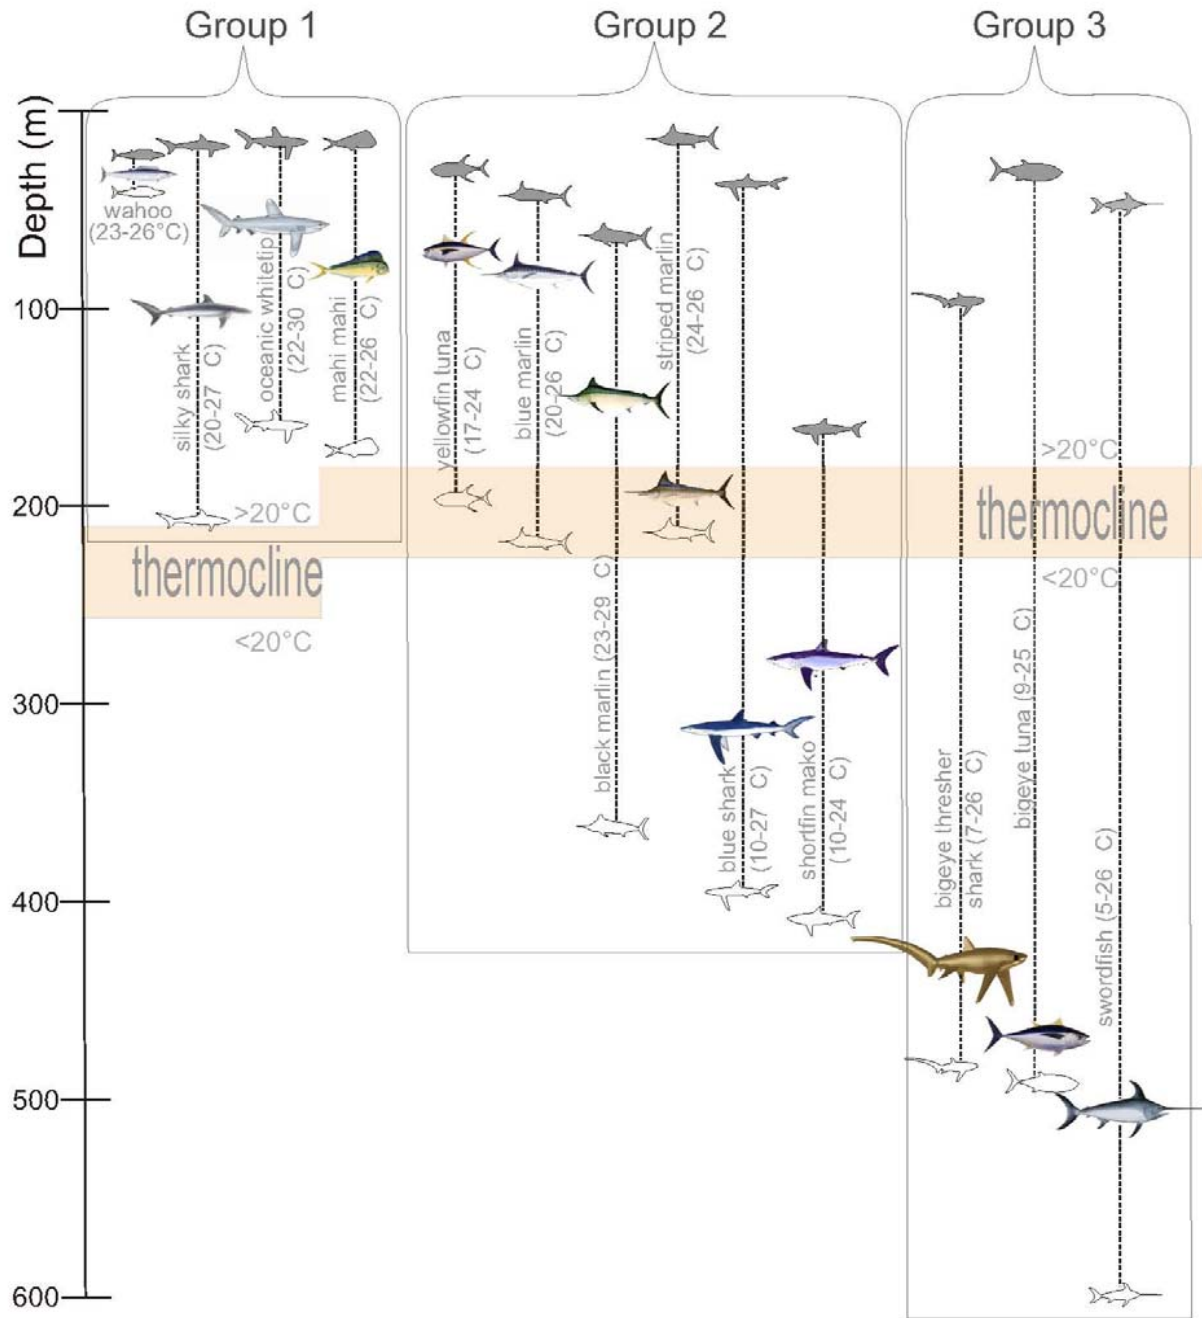

**2=Meso Pelagic**

**3=Bathy-Pelagic**

**Some species  $n_s=1$   $n_s=4$ ; small**

**To Improve Power:**

**Use relevant grouping variables**

# Vertical and Thermal Niche Partitioning in the Pelagic Environment

Epi-Pelagic

Meso-Pelagic

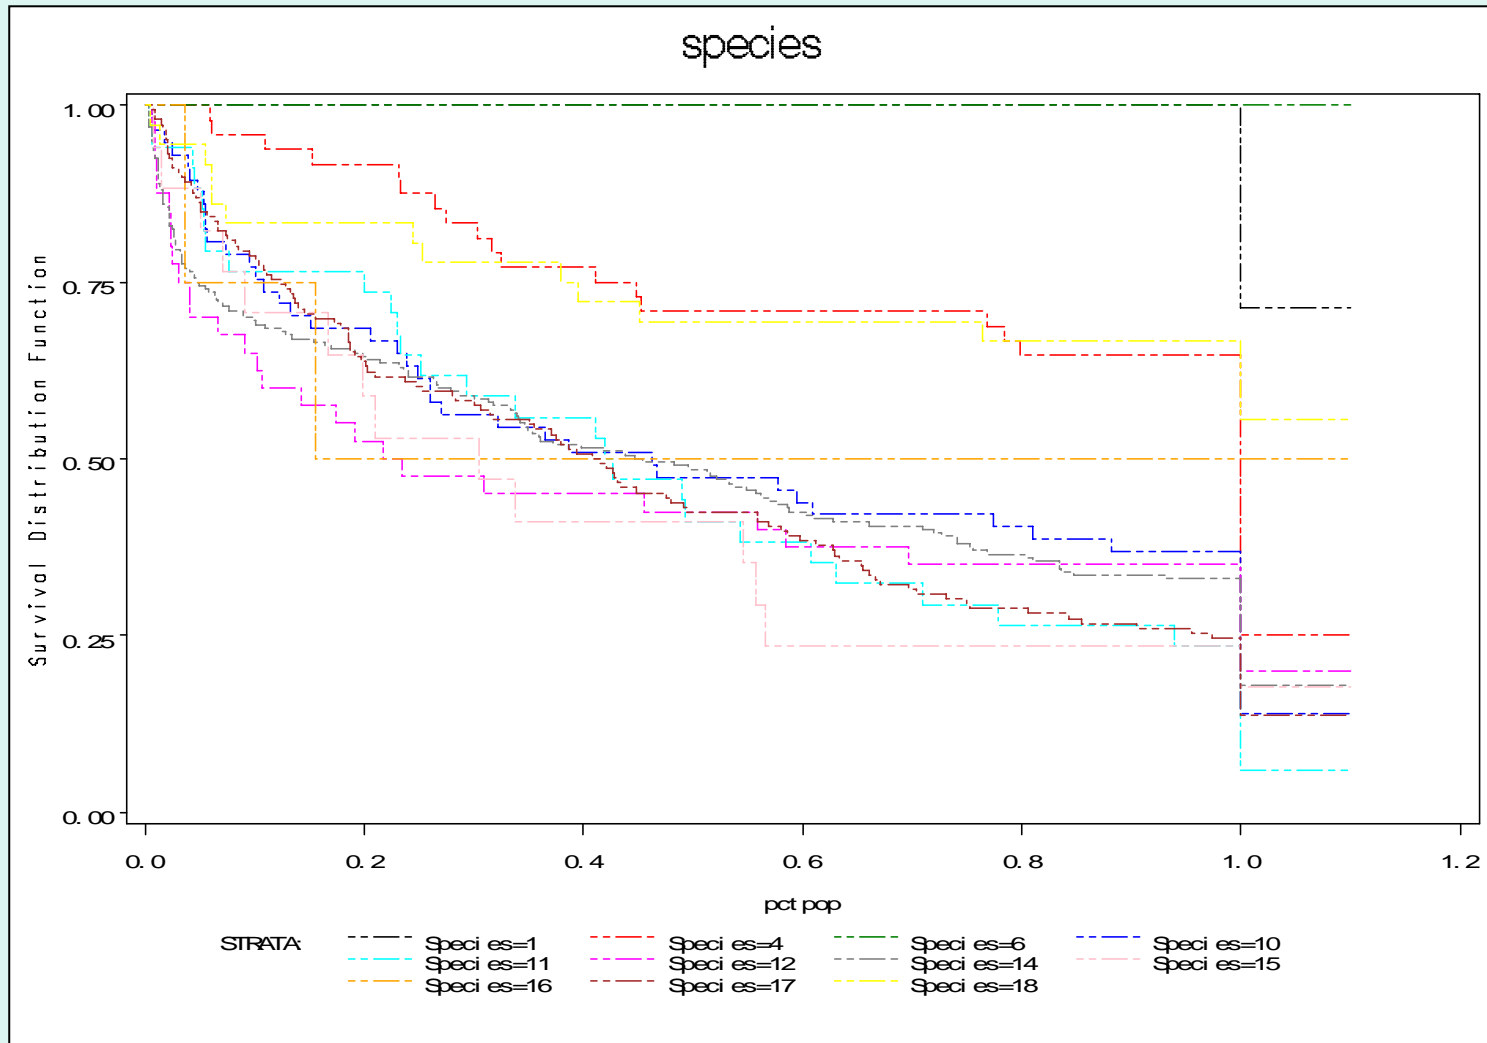

Bathy-Pelagic

Values indicate the 95% depth & temperature preferences shown by electronic tagging studies funded by the University of Hawaii/FRP & NOAA/NMFS.

# Logistic Regression:

## PSAT Reporting Rate

| Parameter                   | $\beta^{\wedge}$ | SE   | p-value |
|-----------------------------|------------------|------|---------|
| Intercept                   | 1.60             | 0.45 | 0.0004  |
| Depthclass (0,1,2,3)        | 0.66             | 0.52 | 0.2     |
| Depthclass <sup>2</sup>     | -0.34            | 0.15 | 0.02    |
| Manufacturer: MT vs WC      | -0.70            | 0.13 | <0.0001 |
| Tagger:BrMus vs Swimmer     | -0.41            | 0.24 | 0.09    |
| Tagger:Domeier vs Swimmer   | -0.38            | 0.22 | 0.078   |
| Tagger:Lutcavage vs Swimmer | 0.89             | 0.26 | 0.0006  |

# Age at Deployment

- **Older PSATs have fewer non-reporters.**
- **Tag age effect disappears with depth class.**
- **Why?**
  - **Older tags on Epi-Pelagic species.**
- **Depth class is the key variable.**

**PSATs Reporting by Tag Age at Deployment**  
**Reporters Avg. Age 172 +/- 7.4 se (6-940)**  
**Non-reporters Avg. Age 134 +/- 12.3 se (15-671)**

# **Conclusions**

## **PSAT Response Rate**

- **Depth class is implicated in non-responding PSATS.**
- **Age at deployment is a non-issue.**
- **Tagger team is a stand in for regional differences.**

# Example

**$\text{propTemp} = \text{Ntemp} / (\text{setpopdays} * 24 / \text{interval})$**

**Ntemp=101; Setpop=184 days; 6hr intervals**

**$\text{propTemp} = 101 / (184 * 24 / 6) = 0.137$**

**We assert: Equivalent.**

**Comparison is valid.**

### Blue marlin

80%  
= Geolocations

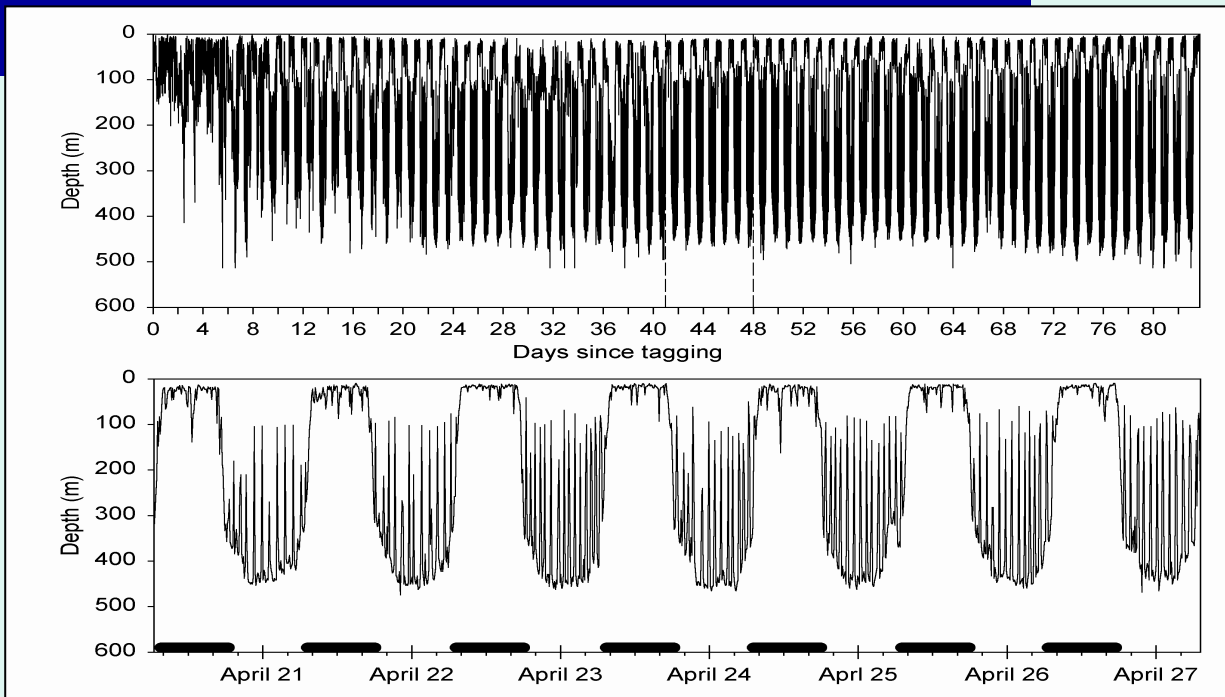

Deep diving species rarely return good geo location data.

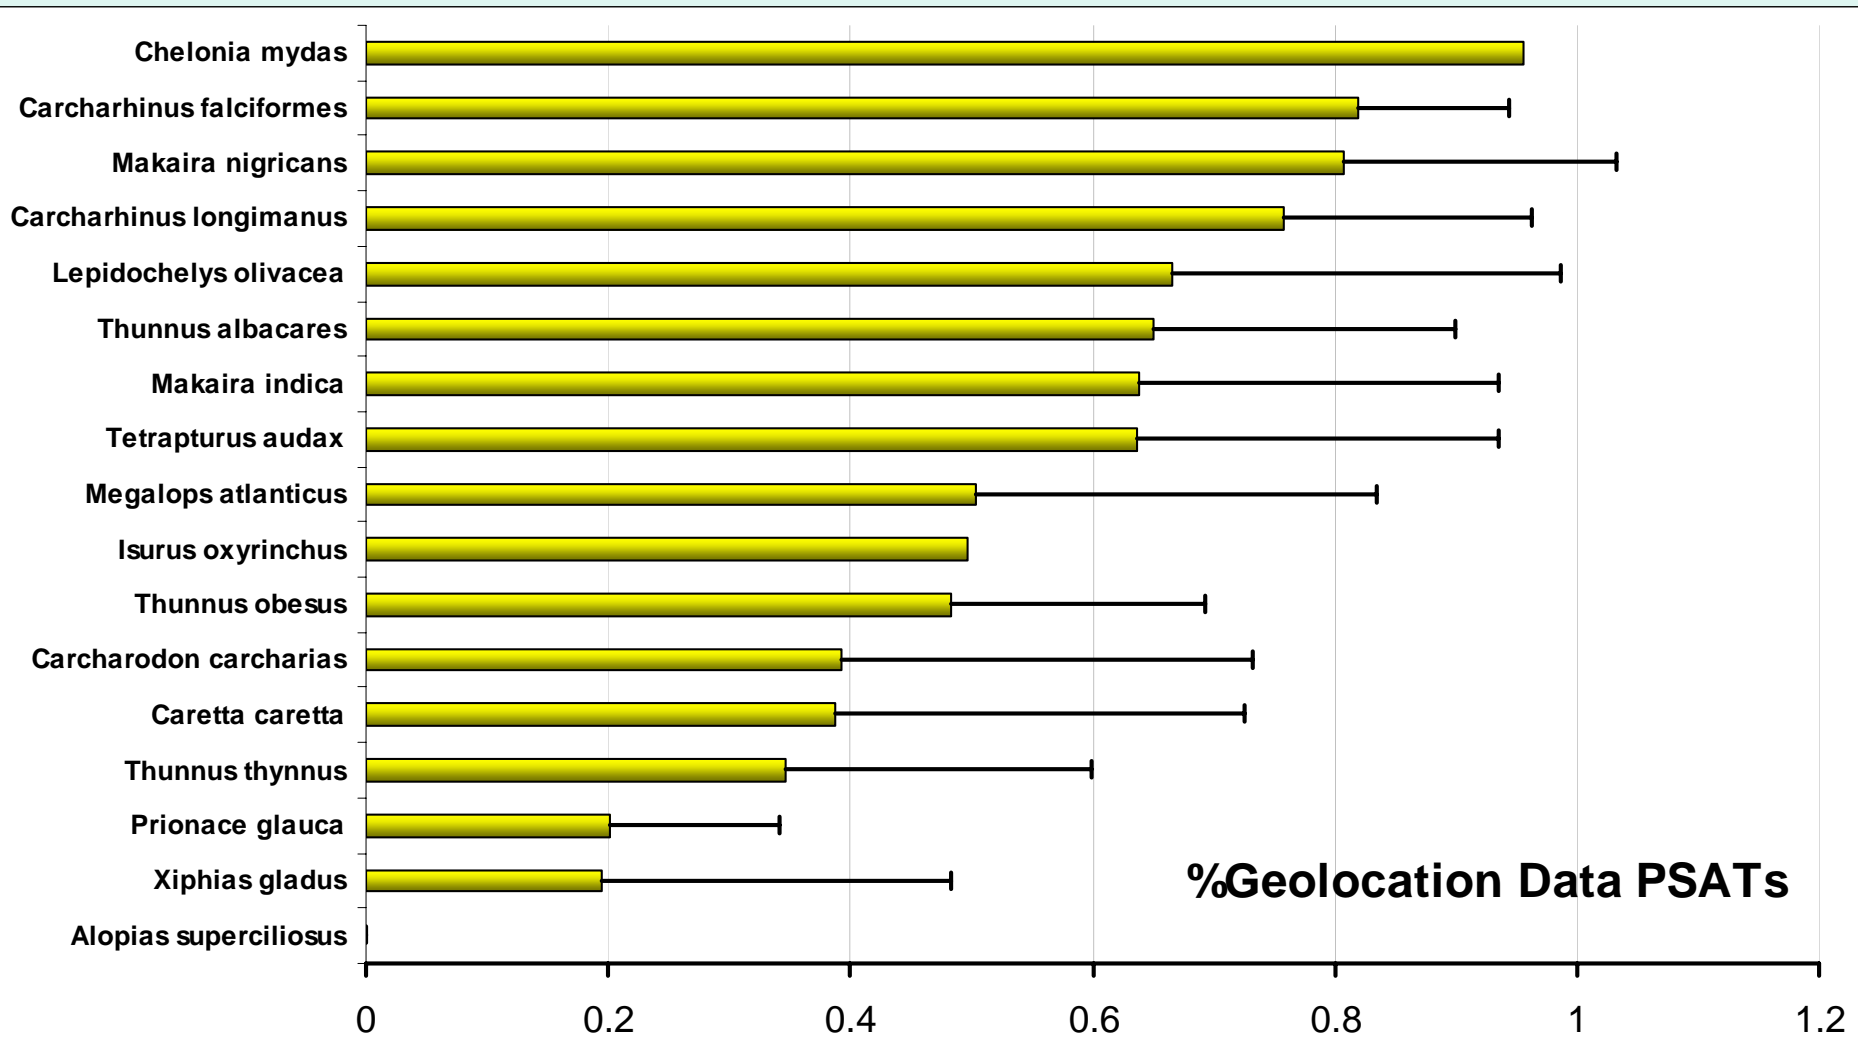

Swordfish - fraction of days at liberty with geolocations = 9%

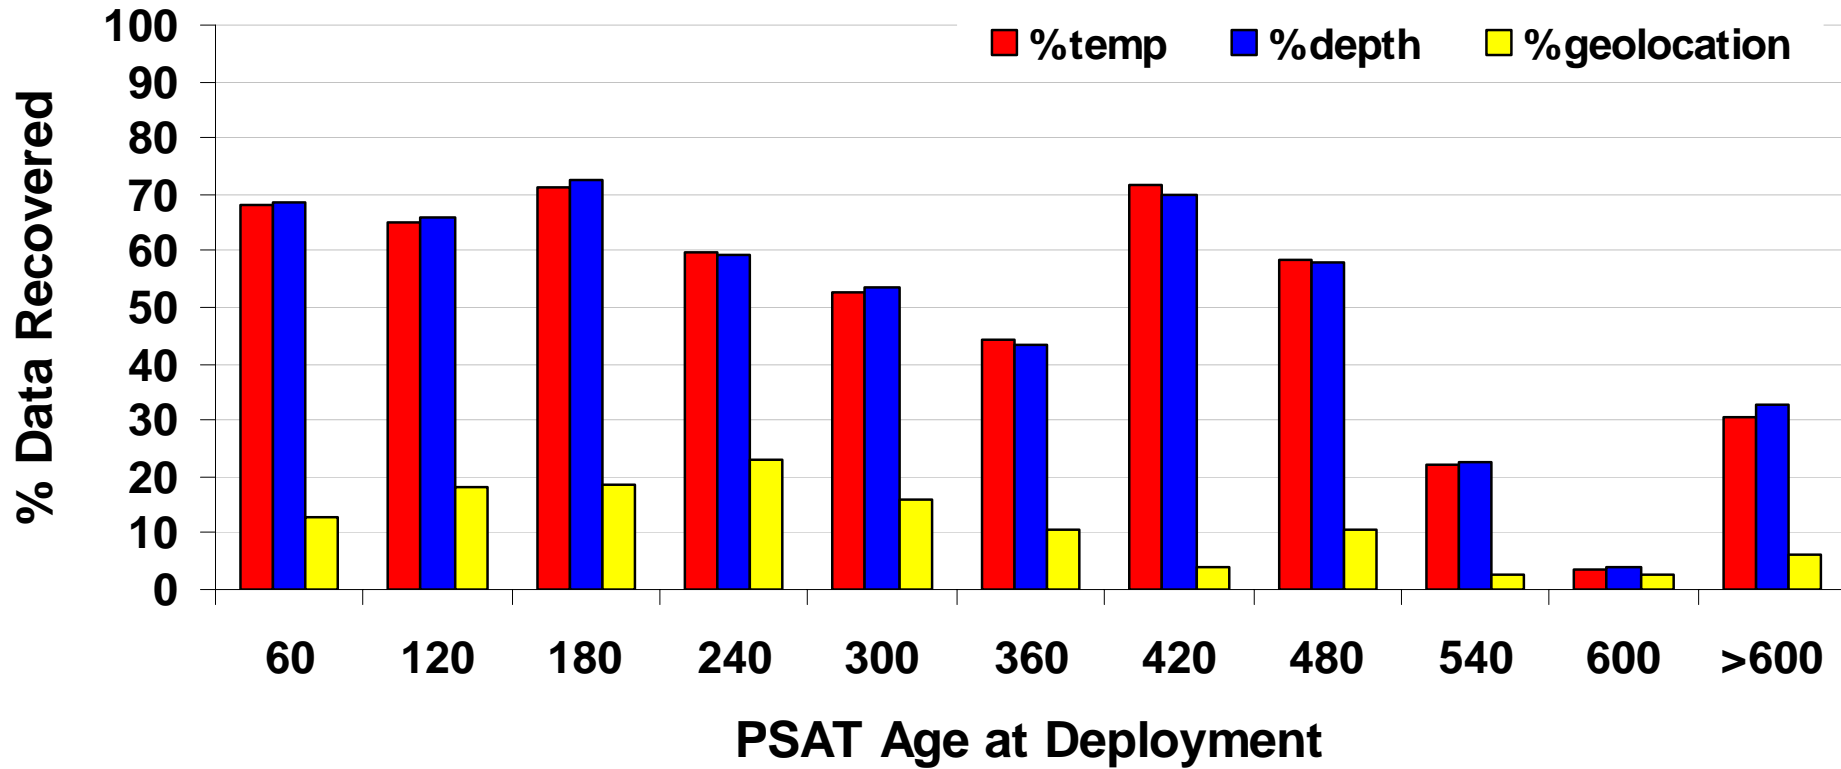

<13%

= No geolocations  
bigeye tuna and  
bigeye thresher sharks

## PSAT Age v. % Data Recovered

# Proportion of data points vs PSAT age at deployment

# Proportion of data points vs. Depth class

# Proportion of data points vs Latitude

# Optimal Set pop days: Thought experiment

- Suppose you argued set pop off days=10?  
Few days at liberty, so then data value could be improved with optimal set pop > 10.
- Suppose you argued set pop off days=1000?  
Then battery wears out...no data.  
Optimal set pop off must be less than 1000.

**CONCLUSION:** There exists an optimal set pop off days  $>10$  and  $<1000$ .

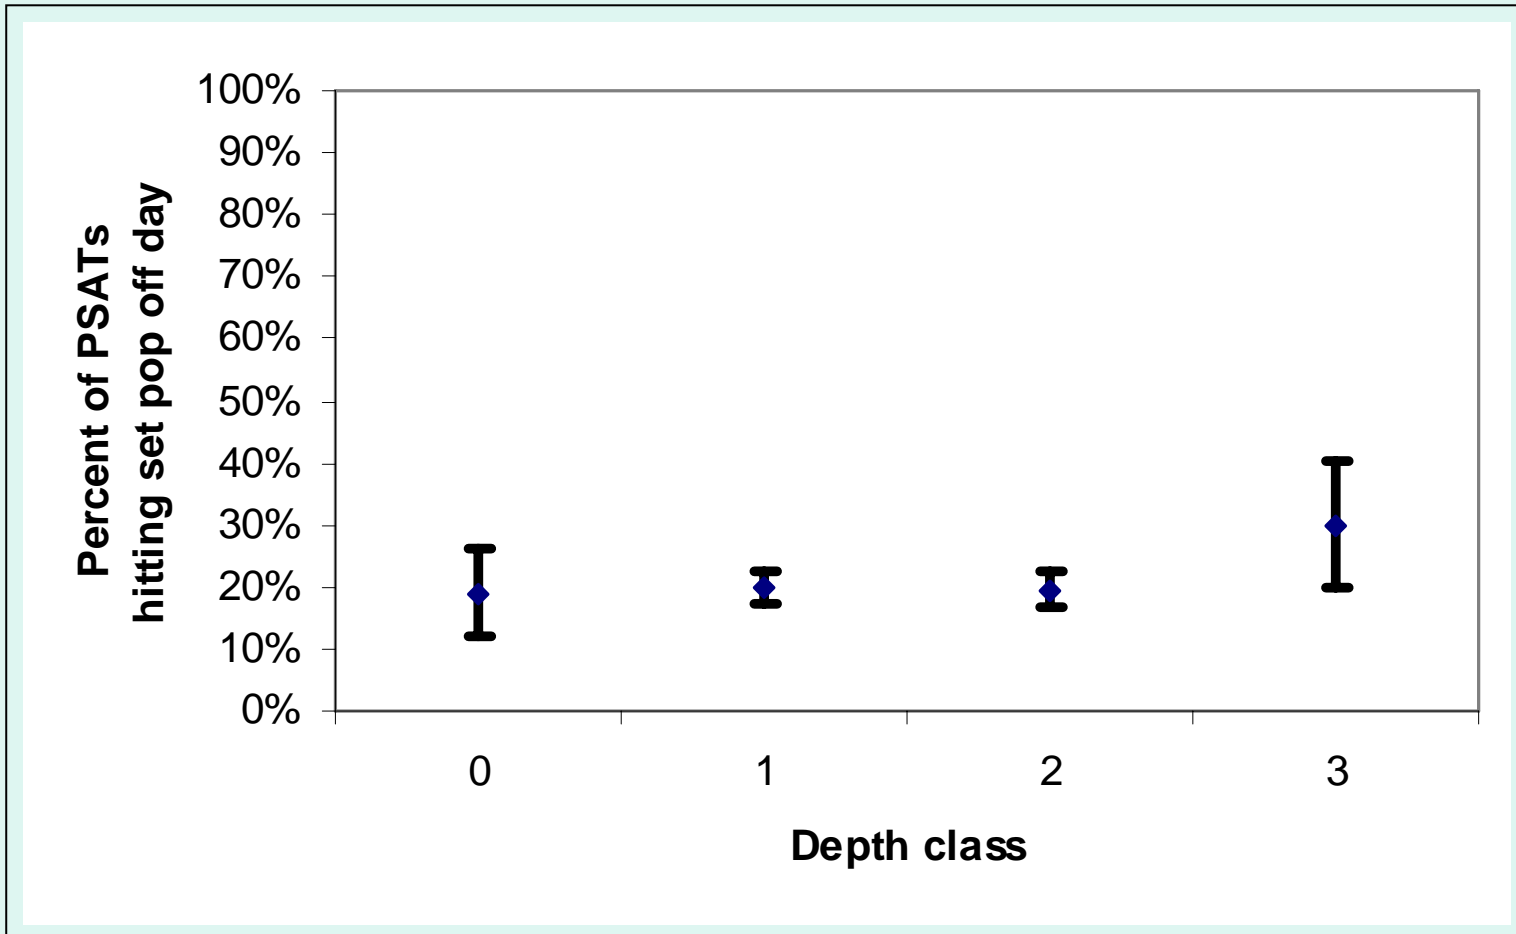

Answer depends on species, manufacturer and latitude.

# Conclusions on PSAT data returned

- Deep diving species poor candidates for geo-location data.
- Age at deployment, depth class, species and latitude are all influential.
- Microwave Telemetry returns larger proportion of expected data points than Wildlife Computers.
- Large gaps in time series are problematic.

# ODDS of Retention

Odds of retention increases with each depth class by a multiplicative factor of 1.72.

Odds of retention increases with flopper/swivel tag-heads by a multiplicative factor of 5.75 compared to umbrellas.

Odds of retention increases with each degree of latitude by a multiplicative factor of 1.02.

# PSAT Retention Conclusions

- **Deeper diving species more likely to retain the tags.**
- **Floppers increase probability of tag retention.**
- **Species in colder Latitudes more like to retain tag.**
- **Domeier's tagger team has best retention rates.**

# Overall Conclusions

- **Bathy-Pelagic has higher non-response rate. Implicates pressure.**
- **More data returned for MT tags.**
- **There exists an optimal set pop days dependent on species.**
- **Floppers increase tag retention.**
- **Depth, Latitude increase retention.**  
**Implicating temperature.**
