Earthquakes in Hawaii:

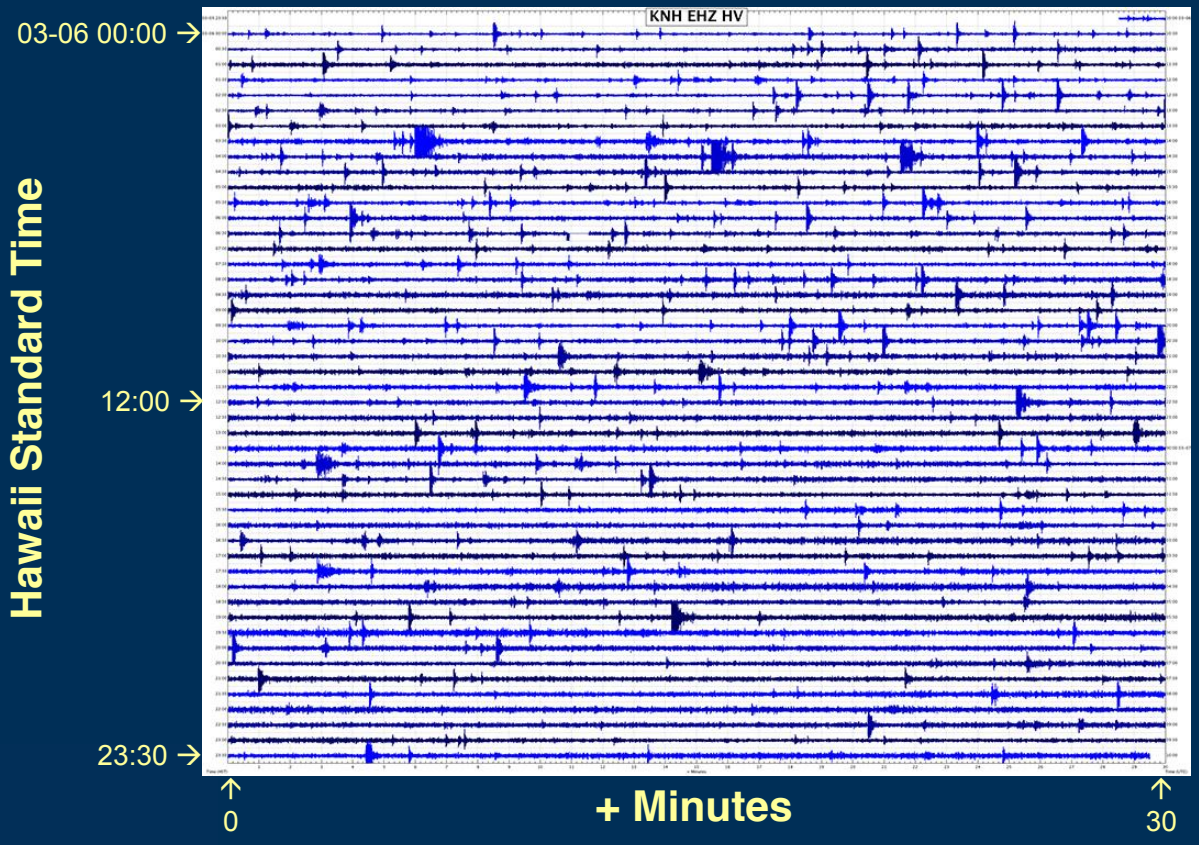
What you need to know

U.S. Department of the Interior
U.S. Geological Survey

Prepared by: Janet L. Babb
Hawaiian Volcano Observatory

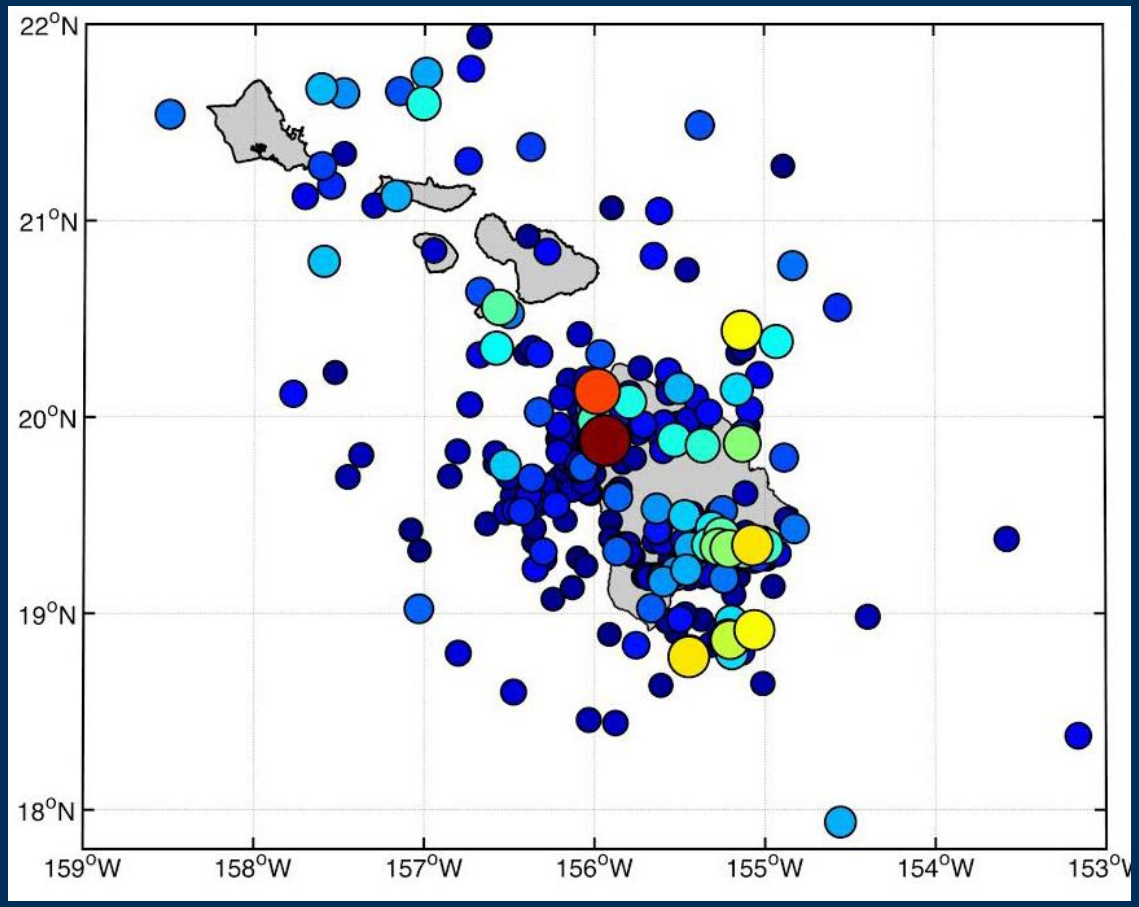
The **State of Hawaii** experiences **thousands of earthquakes** every year.

Most of these earthquakes are closely related to volcanic processes in Hawaii, and are so small they can be detected only by seismometers.



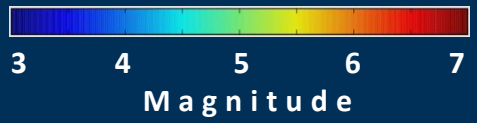
More than 500 earthquakes were recorded by a nearby seismometer during the Kamoamoa fissure eruption along Kīlauea's East Rift Zone on March 6, 2011.

Many earthquakes are strong enough to be felt on one or more islands.



*Locations of the 481 magnitude-**3.0** and stronger earthquakes that were recorded during 2005–2015.*

Color and size of dots reflect earthquake magnitude:

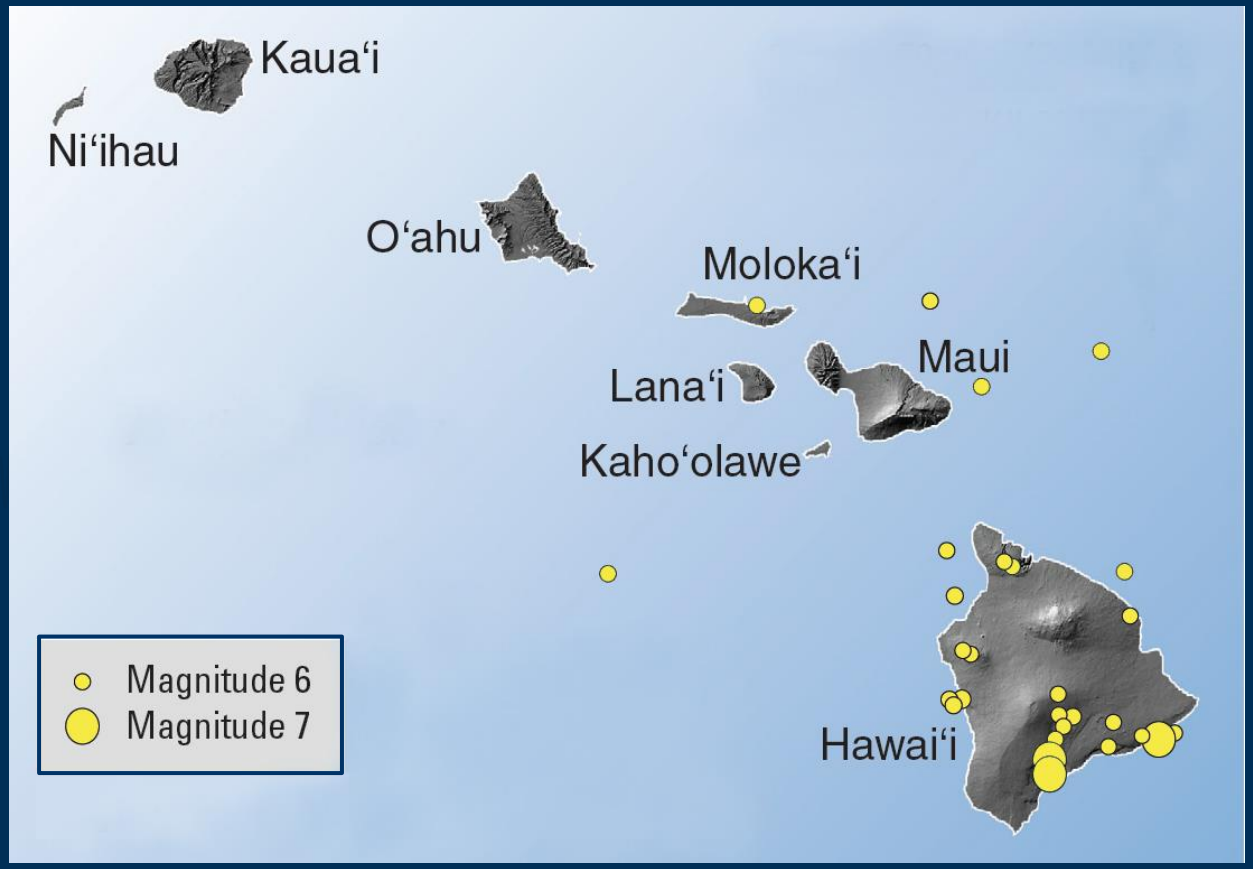


Source: USGS Hawaiian Volcano Observatory

USGS

Some earthquakes are large enough to cause damage and impact residents across the State of Hawaii.

Since 1868, more than 30 magnitude-**6.0** or greater earthquakes have rattled the islands.



USGS

Source: USGS Fact Sheet 2011-3013 (http://pubs.usgs.gov/fs/2011/3013)

Two ways to measure or describe earthquakes:

Magnitude and **Intensity**

USGS

Magnitude

Measures the amount of seismic energy released during an earthquake.

A unit increase in magnitude corresponds to a ~ 30-fold increase in released energy.

Compared to a **M-3.0** earthquake…

- a **M-4.0** earthquake releases ~ 30 times more energy!
- a **M-5.0** earthquake releases ~ 1,000 times more energy!!
- a **M-6.0** earthquake releases ~ 30,000 times more energy!!!
- a **M-7.0** earthquake releases ~ 1,000,000 times more energy!!!!

USGS

Intensity

Describes what people experience during an earthquake—
the effects of shaking on structures and the extent of damage.

Intensity values (Roman numerals) are assigned using the
Modified Mercalli Intensity Scale:

INTENSITY	I	II-III	IV	V	VI	VII	VIII	IX	X–XII
SHAKING	Not Felt	Weak	Light	Moderate	Strong	Very Strong	Severe	Violent	Extreme
DAMAGE	None	None	None	Very Light	Light	Moderate	Moderate/ Heavy	Heavy	Very Heavy

Maximum intensity values are often highest near an earthquake epicenter and decrease with distance from the source.
What you experience (intensity) depends on your location relative to the epicenter.

USGS

Comparison of maximum intensity and magnitude:

Typical Maximum Intensity	Description of Shaking and Damage	Magnitude
I	Not felt except by a very few under especially favorable conditions.	1.0 – 3.0
II	Felt only by a few persons at rest, especially on upper floors of buildings.	3.0 – 3.9
III	Noticeably felt by persons indoors, especially on upper floors. Many people do not recognize it as an earthquake. Parked cars may rock slightly. Vibrations similar to passing truck.	
IV	Felt indoors by many, outdoors by a few. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like truck striking building. Parked cars visibly rock.	4.0 – 4.9
V	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.	
VI	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.	5.0 – 5.9
VII	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken. Noticed by drivers in moving cars.	
VIII	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.	6.0 – 6.9
IX	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.	
X	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.	7.0 and higher
XI	Few, if any (masonry) structures remain standing. Bridges destroyed. Rails bent greatly.	
XII	Damage total. Lines of sight and level are distorted. Objects thrown into the air.	

USGS

Source: USGS Magnitude/Intensity Comparison (http://earthquake.usgs.gov/learn/topics/mag_vs_int.php)

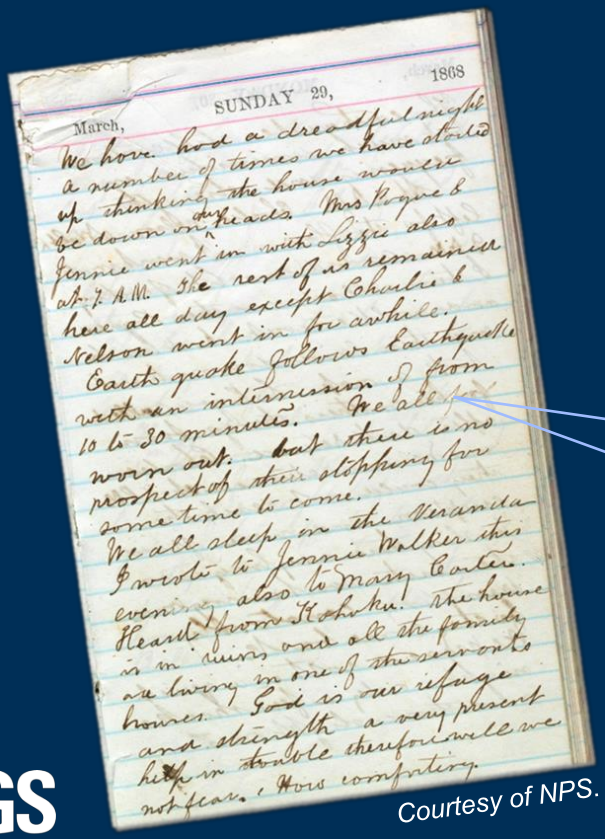
Hawaii's most destructive earthquakes since 1868

USGS

1868 April 2

Magnitude: Estimated at **7.9** (pre-dates the development of magnitude scales)

Location: Ka‘ū District, Island of Hawai‘i



March, SUNDAY 29, 1868

We have had a dreadful night a number of times we have started up thinking the house would be down on our heads. Mrs Rogers & Jennie went in with Lizzie also at 2 A.M. The rest of us remained here all day except Charlie & Nelson went in for awhile. Earthquake follows Earthquake with an intermission of from 10 to 30 minutes. We all worn out. but there is no prospect of their stopping for some time to come. We all sleep in the Veranda I wrote to Jennie Walker this evening also to Mary Carter. Heard from Kahuku. the house is in ruins and all the family are living in one of the servants houses. God is our refuge and strength a very present help in trouble therefore will we not fear. How comforting.

Courtesy of NPS.

Strong foreshocks—including a magnitude-7.0 earthquake on March 28—and thousands of aftershocks shook the island for days.

“A dreadful night…. Earthquake follows earthquake …. We’re all worn out.”

Diary of Annie Brown Spencer, Ka‘ū, Hawai‘i, March 29, 1868.

USGS

The April 2, 1868, earthquake was the largest in Hawaii's recorded history—equivalent in size to the 1906 San Francisco earthquake in California.

Waiʻōhinu church in Kaʻū, Hawaiʻi, destroyed by the 1868 earthquake.
Photo by H.L. Chase, courtesy of the Hawaiian Historical Society.

Shaking: Extremely violent in south Hawaiʻi (Maximum Intensity **XII**)

Extent: Felt throughout the State of Hawaii

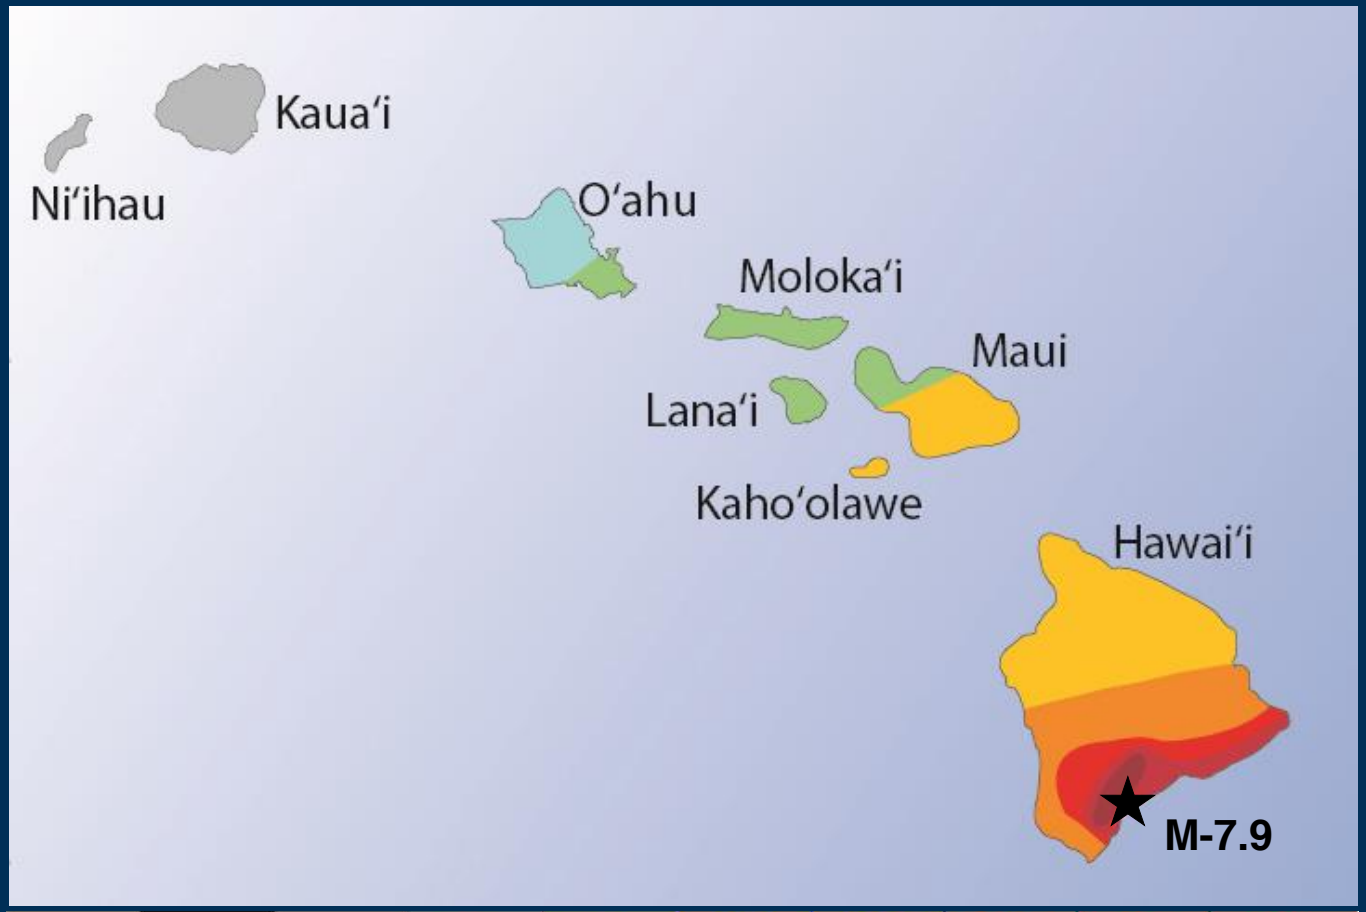
Damage: Very heavy along Hawaiʻi's south coast; moderate in Maui County

This shaking and damage can be depicted on an earthquake intensity map.

USGS

Earthquake Intensity Map — April 2, 1868

Using the Modified Mercalli Intensity Scale, colors on the map reflect the shaking and damage experienced by residents throughout the islands during the 1868 earthquake.



INTENSITY	I	II-III	IV	V	VI	VII	VIII	IX	X+
SHAKING	Not Felt	Weak	Light	Moderate	Strong	Very Strong	Severe	Violent	Extreme
DAMAGE	None	None	None	Very Light	Light	Moderate	Moderate/ Heavy	Heavy	Very Heavy

USGS

Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

The April 2, 1868, earthquake…

- destroyed houses, toppled stone walls, opened ground cracks, and threw people off their feet.
- killed at least 77 people.

Source: Titus Coan, Scribner's Monthly, 1871

- generated a **tsunami**. A wave up to 18 m (60 ft) high along the Kaʻū-Puna coast resulted in 46 deaths.
- triggered multiple **landslides**, including one in Kaʻū's Wood Valley, where 31 people died.
- induced short-lived **eruptions** on Kīlauea and Mauna Loa.

If this earthquake occurred today, damages could cost as much as:

$ 500 million

Source: *PDC's Hawaii HAZUS Atlas*
http://apps.pdc.org/hha/html/hzssummary.jsp

USGS

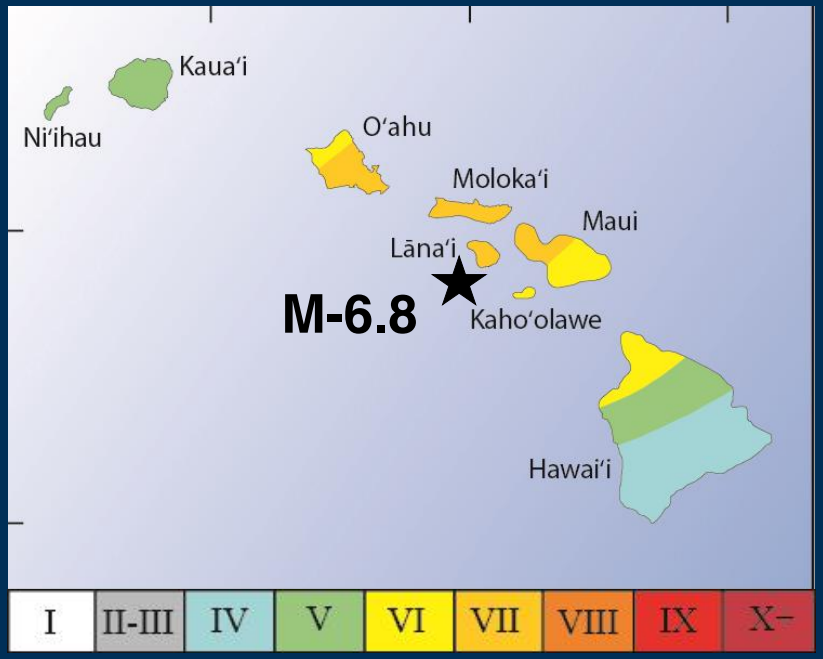
1871 February 19

Shaking: Very strong from East Maui to O‘ahu

Extent: Felt throughout the State

Damage: Extensive in Maui County—some houses uninhabitable, stone walls and fences down, ground cracked open, rockfalls and landslides blocked roads and trails.

Moderate damage on O‘ahu and minor damage on Hawai‘i.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

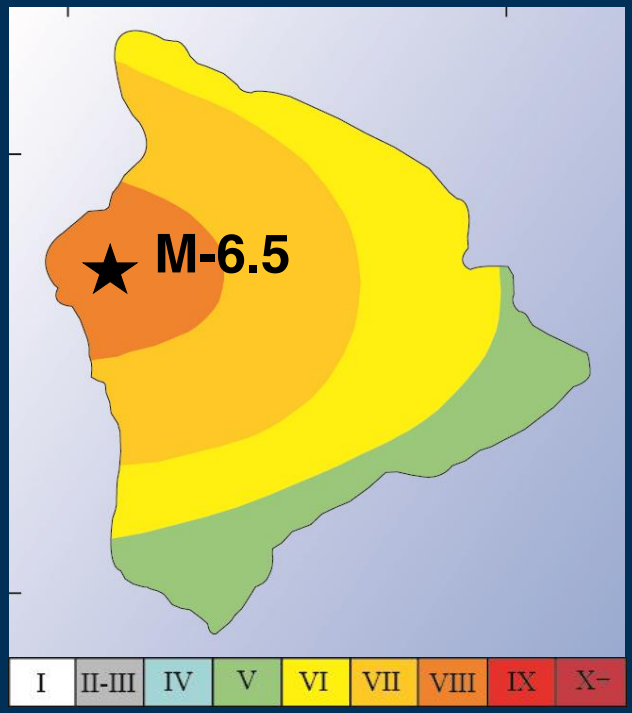
USGS

1929 October 5

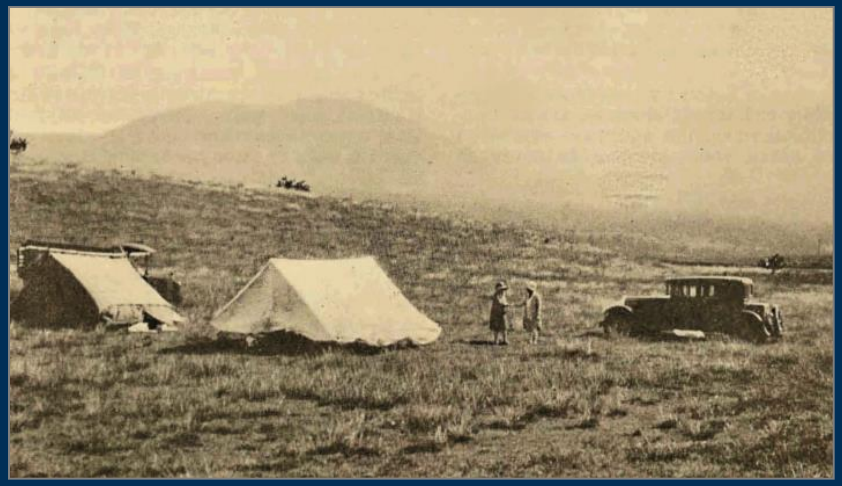
Shaking: Severe on Hualālai

Extent: Felt as far away as O‘ahu

Damage: Heavy in West Hawai‘i—houses, water tanks, stone walls fences, and roadways damaged, some beyond repair.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)



More than 6,200 foreshocks and aftershocks rattled the Hualālai area—including a M-6.2 earthquake on September 25. Fearing that their homes would collapse, some ranch residents camped out near Pu‘uwa‘awa‘a in West Hawai‘i. *USGS photo.*

USGS

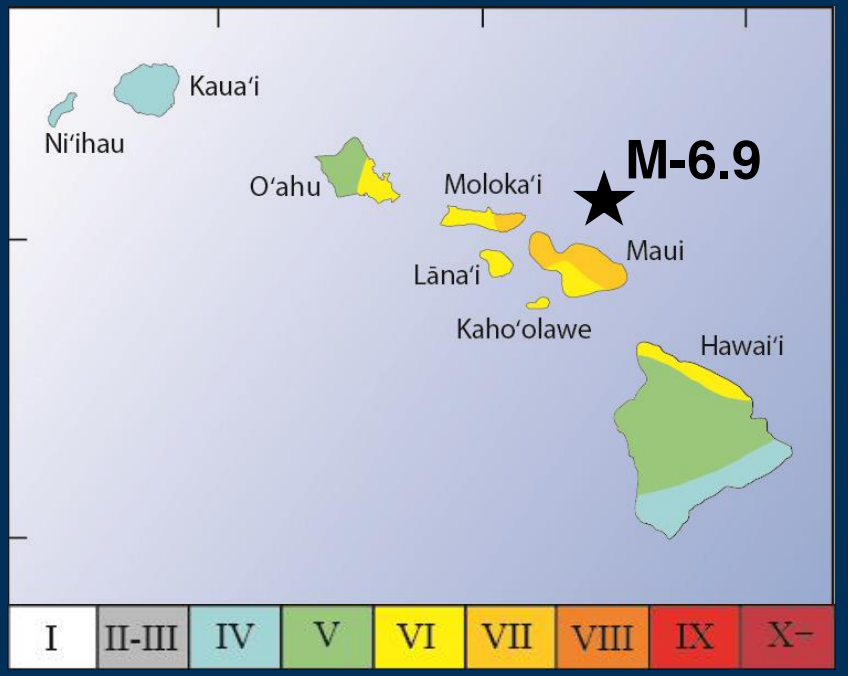
1938 January 22

Shaking: Severe on Maui

Extent: Felt throughout the State

Damage: Heavy on north coast of Maui—oil pipelines and water tanks burst, landslides blocked roads, stone walls collapsed, and ground cracks ruined roads.

Minor damage from north Hawai‘i to Kaua‘i.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

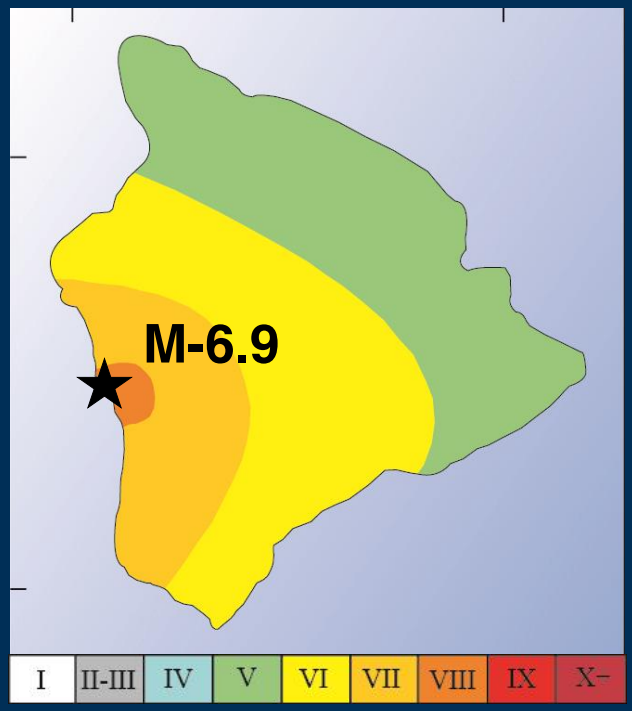
USGS

1951 August 21

Shaking: Severe in West Hawai‘i

Extent: Distinctly felt as far away as O‘ahu

Damage: Roads badly cracked and blocked by rock slides, electric and telephone service disrupted, and ~200 water tanks collapsed in central Kona District. Generated a small local tsunami, but no significant wave damage.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

Collapsed water tank at Hōnaunau School in South Kona, Hawai‘i. USGS photo.

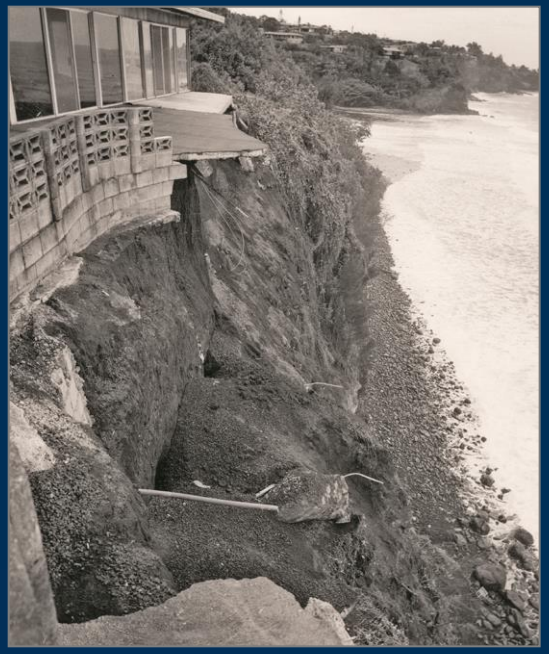
1973 April 26

Shaking: Severe in north Hawai‘i

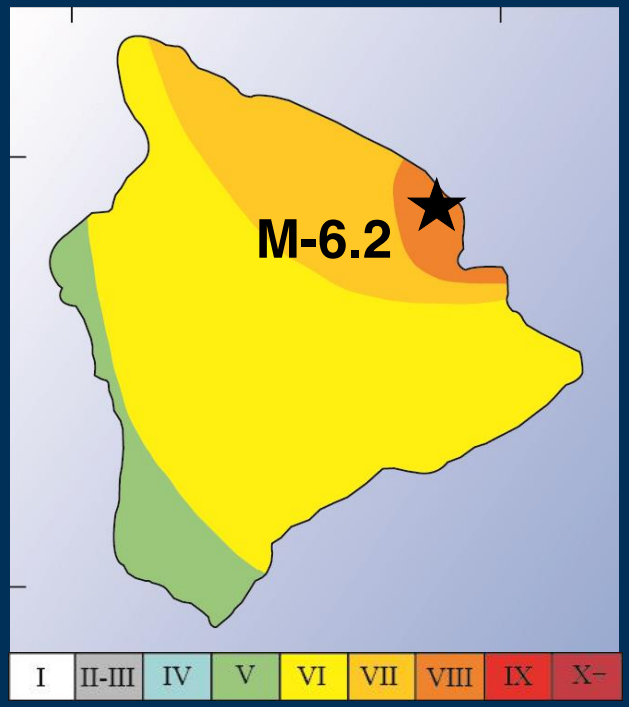
Extent: Felt on all islands

Damage: Estimated at $5.75 million. East Hawai‘i declared a disaster area—water and electric service disrupted; rockslides blocked roads; homes and businesses damaged.

Injuries: At least 11 people injured in Hilo and Waimea.



Coastal damage on the Island of Hawai‘i.
Photo by Larry Kadooka, Hawai‘i Tribune-Herald.



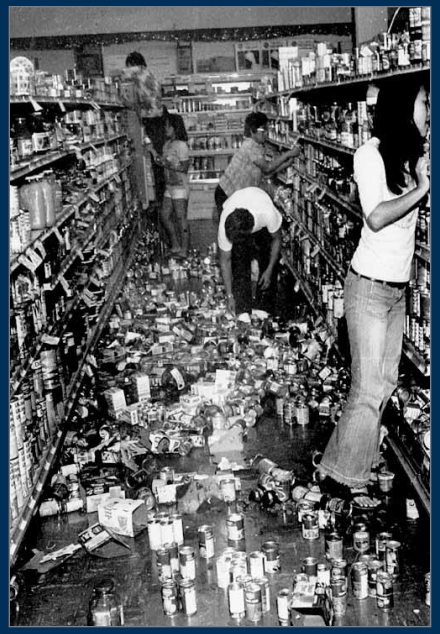
Modified from: USGS Bulletin 2006
(http://pubs.er.usgs.gov/publication/b2006)

1975 November 29

Shaking: Severe in Puna District

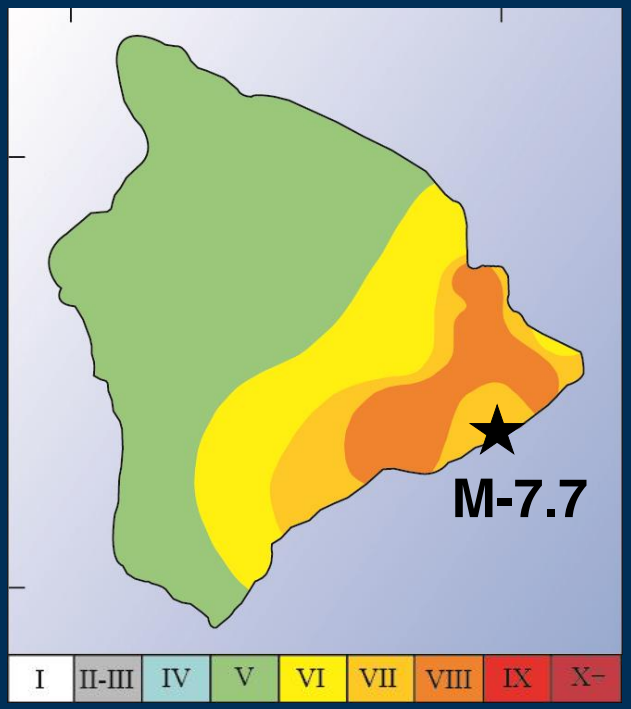
Extent: Felt across the State

Damage: $4.1 million *(including tsunami damage)*. Massive ground cracking and landslides damaged roads. Homes shifted off foundations. Structural and equipment damage at businesses.



Impact on Hilo, Hawai'i, supermarket.
Photo by Larry Kadooka, Hawai'i Tribune Herald.

Chain of Craters Road, Hawai'i Volcanoes National Park. USGS photo.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

If this earthquake occurred today, damages could cost as much as:

$ 500 million

The November 29, 1975, earthquake generated a devastating **tsunami**.

At Halapē, two campers died and 19 others were injured when the tsunami swept over them.

The coastline subsided by as much as 3.5 m (11 ft) during the earthquake, submerging Halapē's coconut grove in seawater.

Red pack marks the extent of the tsunami inundation at Halapē. *USGS photo.*

The tsunami—with waves up to 14.6 m (48 ft) high—caused extensive damage on the Island of Hawai'i's south coast.

A Punalu`u house demolished by the 1975 tsunami.
Photo by David Shapiro, Honolulu Star-Bulletin.

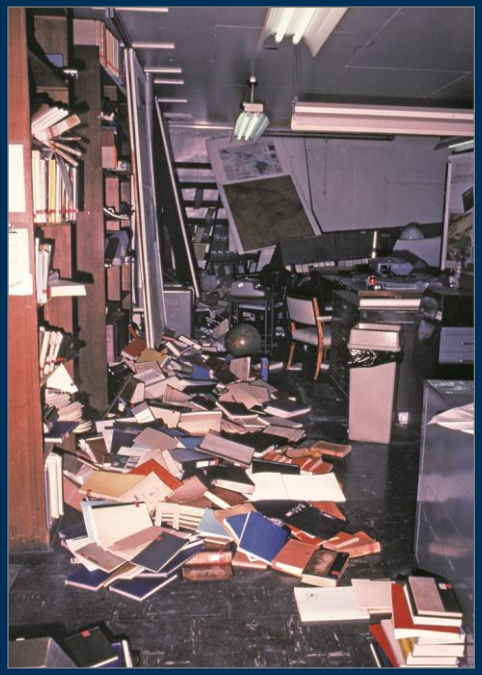
1983 November 16

Shaking: Violent in Volcano area

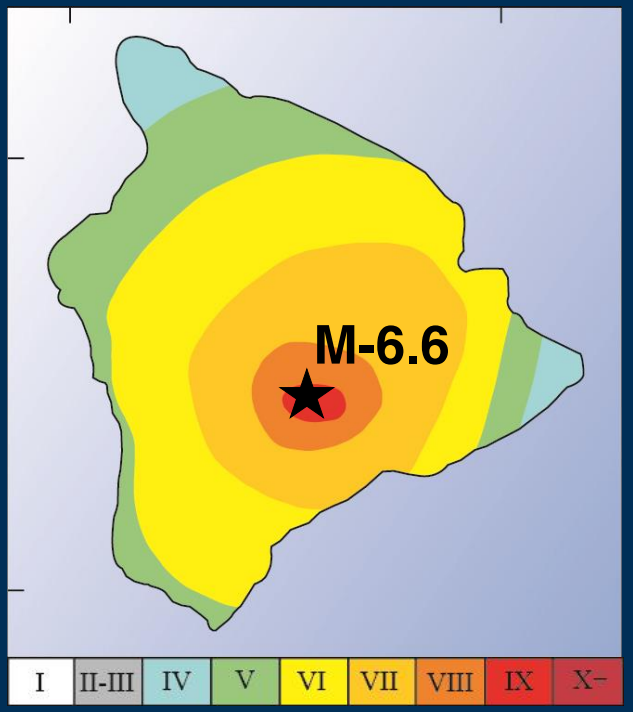
Extent: Felt as far away as Kauai

Damage: Estimated at $7 million in 1983. Houses moved off foundations, roads heavily cracked and temporarily closed, water tanks and chimneys collapsed, landslides and severe ground failures occurred in many areas.

Injuries: At least 6 people injured.



Damage in the Hawaiian Volcano Observatory library. USGS photo.



Modified from USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

If this earthquake occurred today, damages could cost as much as:

$ 200 million

1989 June 25

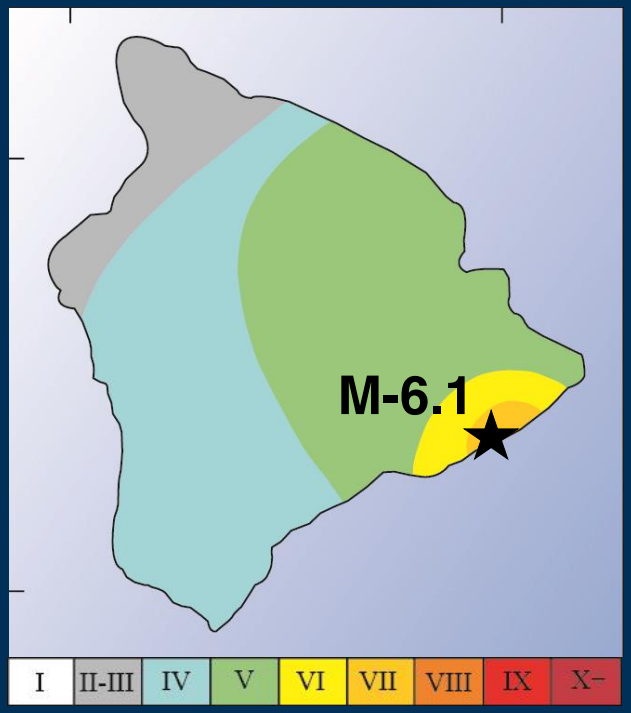
Shaking: Strong in southeast Puna District

Extent: Felt as far away as O‘ahu

Damage: Estimated at $1 million in 1989. Several homes collapsed; many others suffered significant structural damage.

Generated a small local tsunami, but no wave damage was reported.

Collapsed home in Kalapana, Hawai‘i. USGS photo.



Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

If this earthquake occurred today, damages could cost as much as:

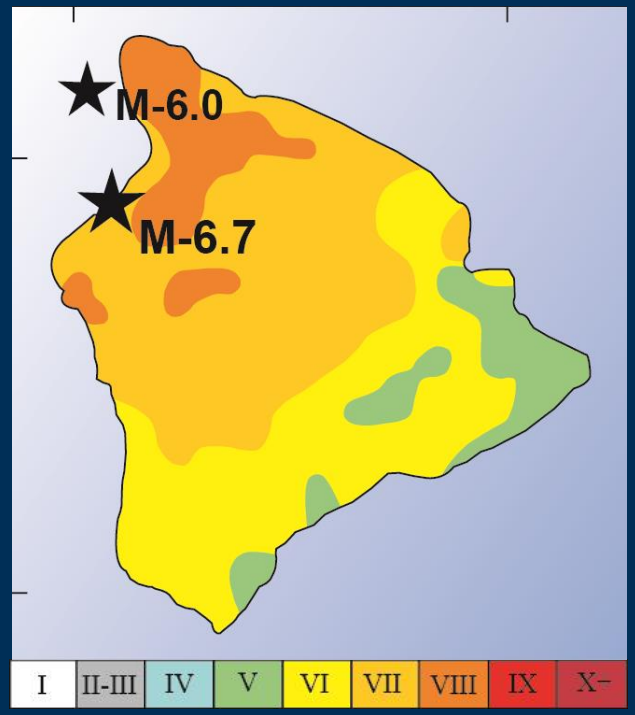
$ 300 million

2006 October 15

Shaking: Strong to severe in North Kona and Kohala Districts

Extent: Felt throughout the State

Damage: Heavy damage to Kawaihae harbor, homes, hotels, roads, and bridges; extended power outage on O‘ahu; landslides blocked roads.



Minutes after the M-6.7 Kīholo Bay earthquake, a M-6.0 earthquake struck offshore of Māhukona, Hawai‘i.

A massive rockslide diverted the course of Honokāne Nui Stream in northeast Hawai‘i. USGS photo.

BIG ISLAND EARTHQUAKE

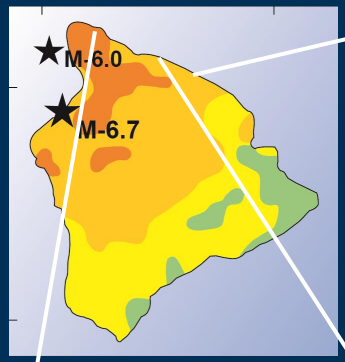
Hawaii Tribune Herald

October 31, 2006 Proudly serving Hilo and the Big Island since 1923 50 cents

Quake damage may exceed $200M

Engineers assessing hard hit areas say initial estimate didn't include individual homes

Examples of damage on the Island of Hawai'i caused by the 2006 Kīholo Bay and Māhukona earthquakes.
USGS photos.



Highway 19, southeast of Kawāili Bridge.

Kalāhikiola Congregational Church, Kapa'au.

Honoka'a High School.

Bottom line…

Hawaii has a long history of destructive earthquakes.

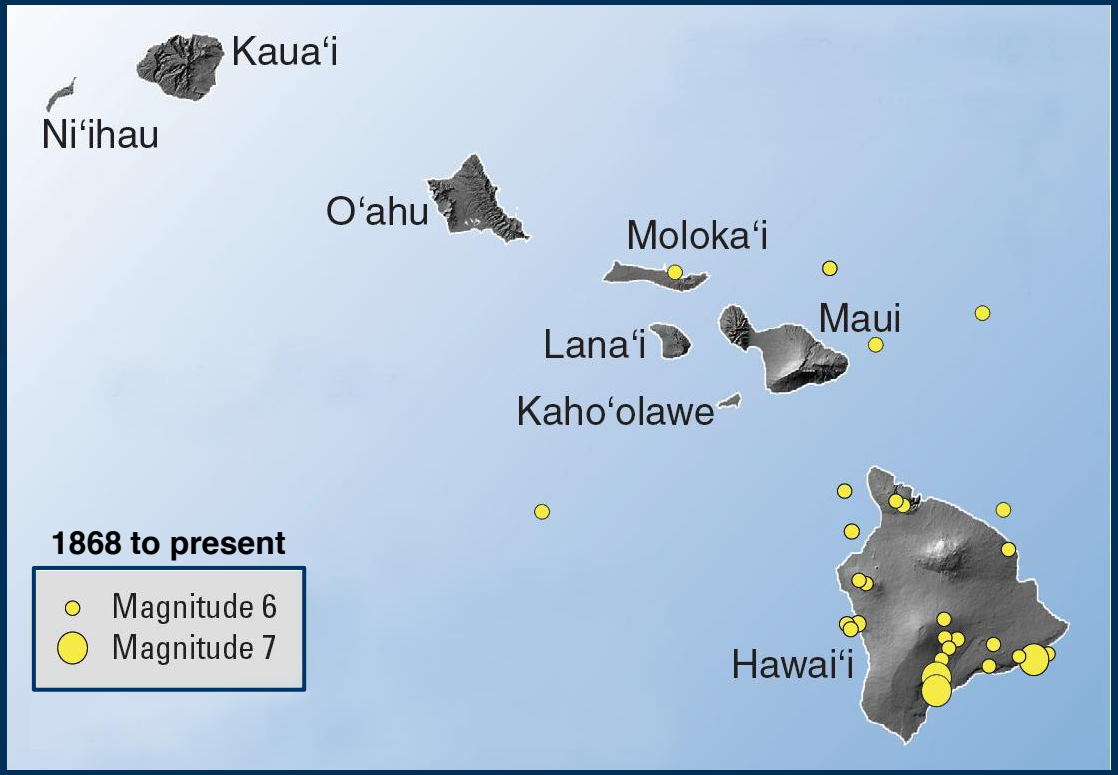
Hawaii's large earthquakes are equivalent in size to the strong earthquakes that occur along California's San Andreas fault. For example:

- 1906 San Francisco **(M-7.9)**
- 1989 Loma Prieta **(M-6.9)**
- 1994 Northridge **(M-6.7)**

USGS

Remember…

Large earthquakes can impact the entire **State of Hawaii**.



USGS

Source: USGS Fact Sheet 2011-3013 (http://pubs.usgs.gov/fs/2011/3013)

The probability of a destructive magnitude-6.5 or higher earthquake striking the Hawaiian islands:

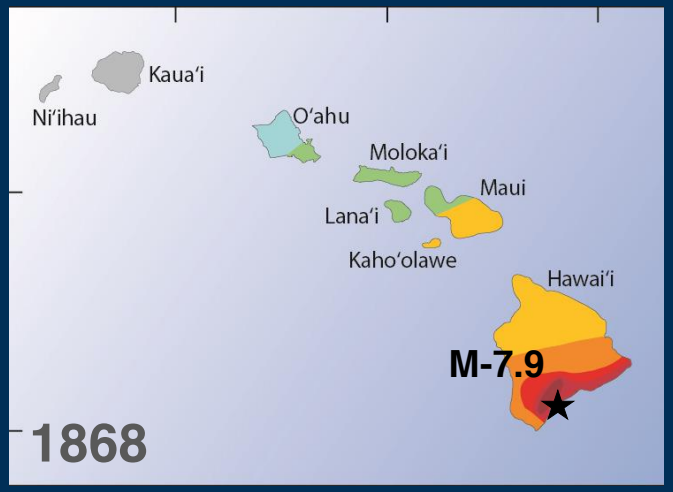
… in the next **10** years is 50%.

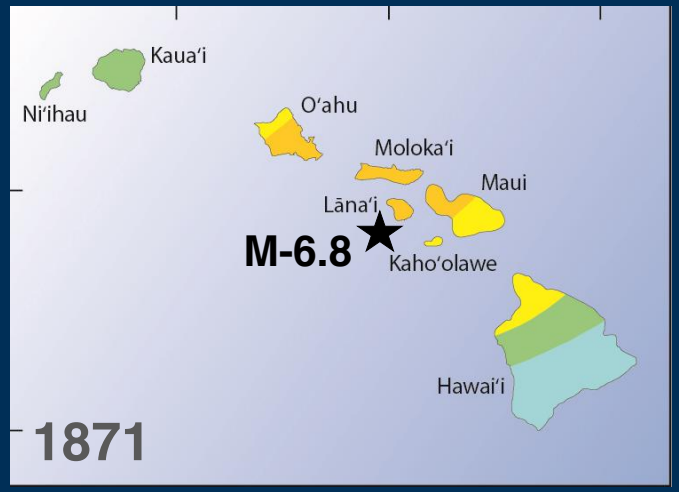
… in the next **20** years is 75%.

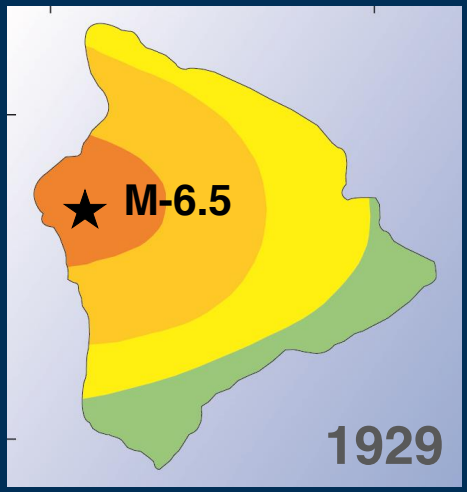
… in the next **50** years is 97%.

USGS

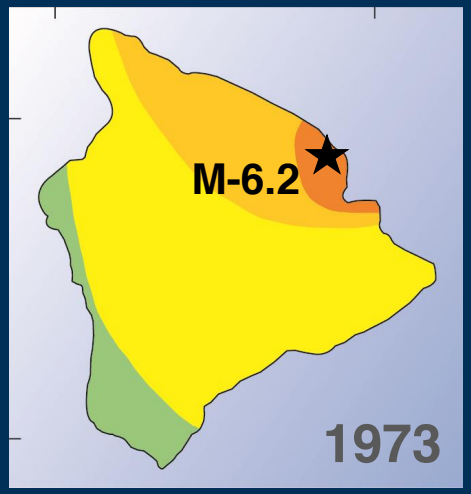
Source: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

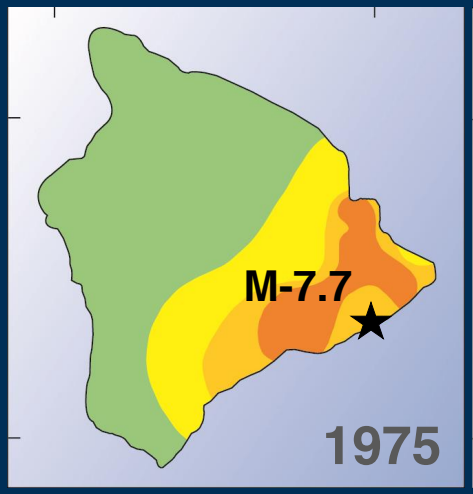


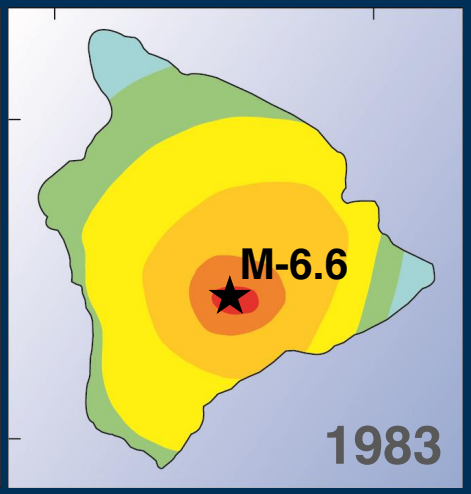


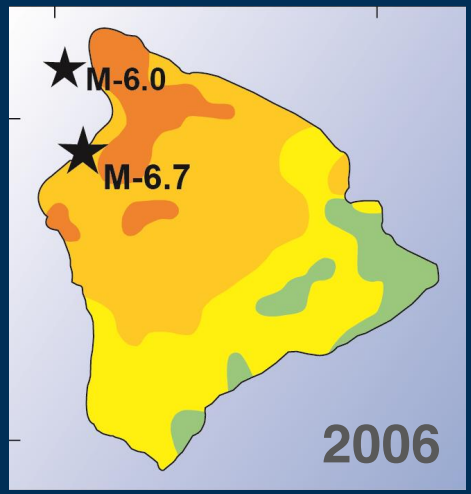


So... It's not **IF** a destructive earthquake will strike Hawaii, but **WHEN** the next one will happen.









Modified from: USGS Bulletin 2006 (http://pubs.er.usgs.gov/publication/b2006)

Do you know how to protect yourself during Hawaii's next big earthquake?

USGS

To reduce injury (or worse) during an earthquake, take these actions:

Source: http://www.shakeout.org/hawaii/dropcoverholdon/

USGS

If you're inside a building, stay there, *and …*

DROP to the floor (before the earthquake drops you)!

Take **COVER** under a sturdy table or desk!

HOLD ON to your shelter—and move with it until the shaking stops!

Photo: Humboldt State University (http://humboldt.edu/shakyground/)

USGS

If you're at or near the beach…

Drop! Cover! Hold on!
until the strong shaking stops.

Then…

quickly walk to higher ground—or inland—until you are at least 30 m (100 ft) above sea level, or beyond the marked tsunami hazard zone. Avoid steep cliffs and watch for falling rocks.

Strong earthquakes in Hawaii have generated **deadly tsunami**, so moving to higher ground after the next "big one" could save your life.

USGS

For more information on what to do during an earthquake, including situations when you cannot get beneath a table, please see…

"Recommended Earthquake Safety Actions in Hawaii"

http://shakeout.org/hawaii/resources/

USGS

Recommended Earthquake Safety Actions in Hawaii

Federal, State, and local emergency management experts and other official preparedness organizations all agree that "**Drop! Cover! Hold On!**" is the appropriate action to take to reduce injury and prevent death during earthquakes.

The **Great Hawaii ShakeOut** , an annual earthquake awareness and preparedness event (shakeout.org/hawaii/), is an opportunity to practice protecting yourself during an earthquake.

You cannot tell from the initial shaking of an earthquake if it will suddenly become intense, so…always, and immediately, Drop! Cover! and Hold On!

- **DROP** to the ground (before the earthquake drops you!)
- Take **COVER** by getting under a sturdy desk or table
- **HOLD ON** to your shelter and be prepared to move with it until the shaking stops

If a table or desk is not near you, drop to the ground and cover your head and neck with your hands and arms. If possible, crawl to an inside corner of the room. Stay in a crawling position to protect your vital organs and to be ready to move if necessary.

If you are unable to Drop! Cover! Hold On!: If you have difficulty dropping safely to the floor on your own, get as low as possible, protect your head and neck, and move away from windows or other items that can fall on you.

Guidelines on how to protect yourself in specific situations

If you are inside a building: Stay inside, and Drop! Cover! Hold on! until the shaking stops. Do not move to another location or outside. Moving outside can put you in greater danger than staying inside because exterior walls and windows often collapse. Trying to walk or run during strong shaking can also result in serious injury if you fall.

In bed: If you are in bed, stay there. Hold on and protect your head with a pillow. You are less likely to be injured by staying in bed. Broken glass on the floor has caused injuries to those who have rolled to the floor or tried to get to a doorway.

Practice makes perfect!

You are encouraged to practice

Drop! Cover! Hold on!

during…

Held on the 3rd Thursday in October

2015 – October 15 … at 10:15 a.m.
2016 – October 20 … at 10:20 a.m.
2017 – October 19 … at 10:19 a.m.
2018 – October 18 … at 10:18 a.m.
2019 – October 17 … at 10:17 a.m.

USGS

ShakeOut began in California in 2008.

This earthquake drill is now global, with millions of people from around the world participating each year.

Hawaii joined **ShakeOut** for the first time in 2013. Details about this year's **Great Hawaii ShakeOut** are posted at:

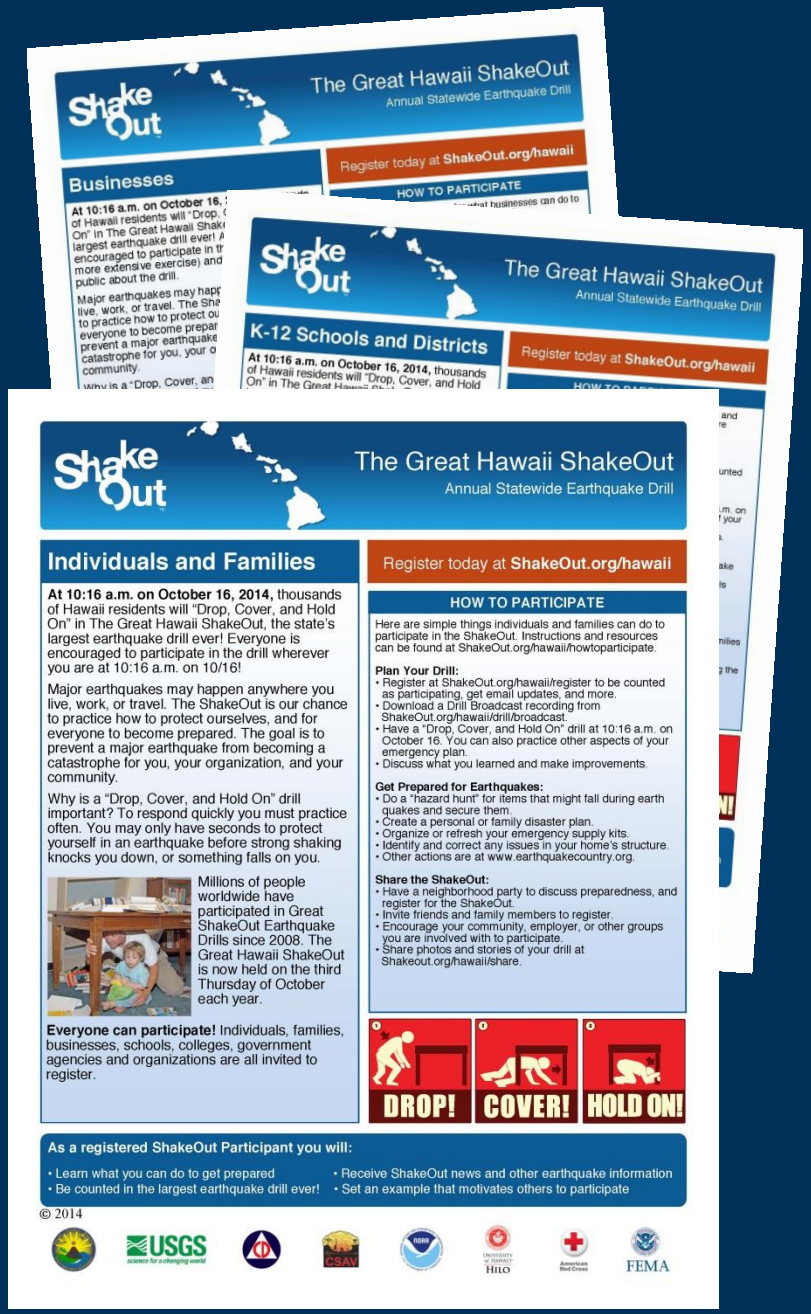
www.shakeout.org/hawaii

USGS

ShakeOut Resources

Information on how to participate in the **Great Hawaii ShakeOut** and resources to help you know what to do during Hawaii's next earthquake are available online:

www.shakeout.org/hawaii



USGS

Summary:

- ✓ Large, destructive earthquakes have impacted the State of Hawaii in the past—and will do so in the future.
- ✓ You must know how to protect yourself during an earthquake.
- ✓ Practice **Drop! Cover! Hold on!** so that you can react quickly during the next earthquake.
- ✓ The **Great Hawaii ShakeOut** is a good time to practice.

USGS

Annual drills:

2015 *– October 15 … at 10:15 a.m.*
2016 *– October 20 … at 10:20 a.m.*
2017 *– October 19 … at 10:19 a.m.*
2018 *– October 18 … at 10:18 a.m.*
2019 *– October 17 … at 10:17 a.m.*
